System Attributes	AMI (GK2A)	GOCI-II (GK2B)	GEMS (GK2B)
Spectral Range	470~1,330nm	370~885nm	300~500nm
Spatial Resolution	0.5~1km (VIS) 1~2km (IR)	< 250m (LA) < 1,000m (FD)	< 56Km ² at Seoul
Spectral Resolution	400~1,000nm	10~40nm	0.6nm
No. of Channels	16	13	Hyper Spectral
Observation Coverage	FD, RA, ELA, LA	≥ 2,500×2,500km (LA) ≥ +/-60deg (FD)	≥ 5,000km×5,000km, (45°N~5°S, 75°E~145°E)
Duty Cycle	FD : 6 times/hr	10 times/day Full Disc 1 time per day	≥ 8 times/day
Imaging Time	FD: 10 min, LA : 120 sec	≤ 30 min	≤ 30 min

GEMS Instrument Flight Model

- Step-and-stare UV-Vis imaging spectrometer scanning at least 8/day in 30 min
- Daily solar and dark calibration
- ✓ Pre Shipment Review(PSR) finished in Jan. 26th, 2018, delivered to KARI in Feb., 2018
- ✓ GEMS launch window : Sep 2019 – Feb 2020

Spatial Resolution Comparisons

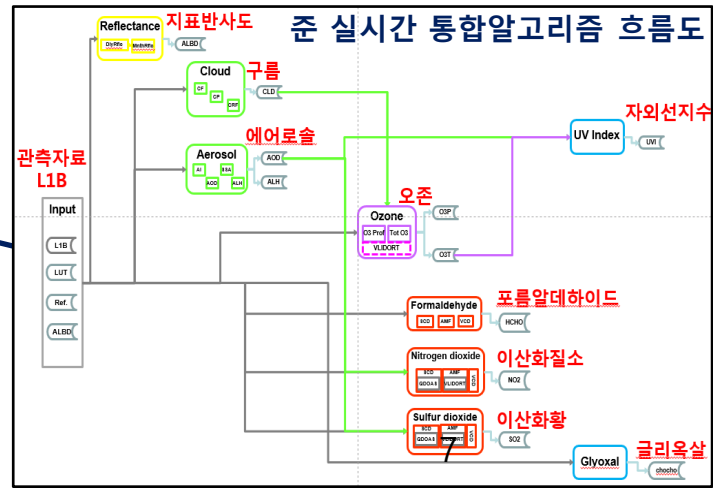

GEMS Processor

Stray light correction with Simulated Radiance

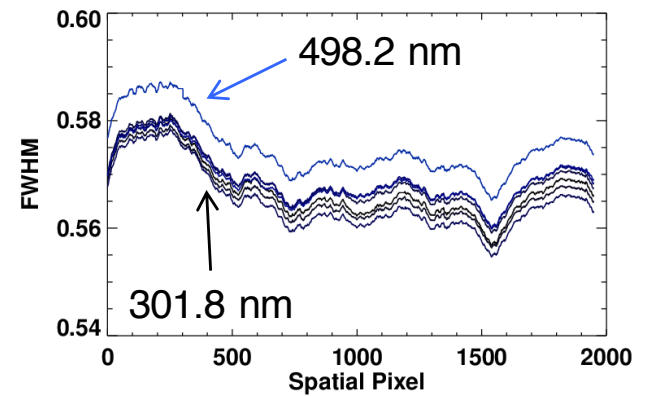

Dataset

L0-1 Processor

- Developed by BATC & KARI
- Dark correction :
 - fitting by temperature changes needed
- Smear correction :
 - ratio of frame transfer time to integration time, with previous frame effects considered
- *Straylight correction :*
 - *matrix, with 19x19 pixels aggregated due to computing time issue*
- Spectral calibration :
 - Reference solar spectrum convolved with GEMS bandpass functions, polynomial equation
- Onboard LED calibration :
 - for linearity, gain and PRNU(TBD)
- Polarization correction :
 - VLIDORT, Linear polarization sensitivity tests, LUT in collaboration with TEMPO team

GEMS Bandpass

GEMS Straylight

- Spectral Spike
 - Compare to Spatial Line Spread Function, there are lots of spikes at Spectral Line Spread Function

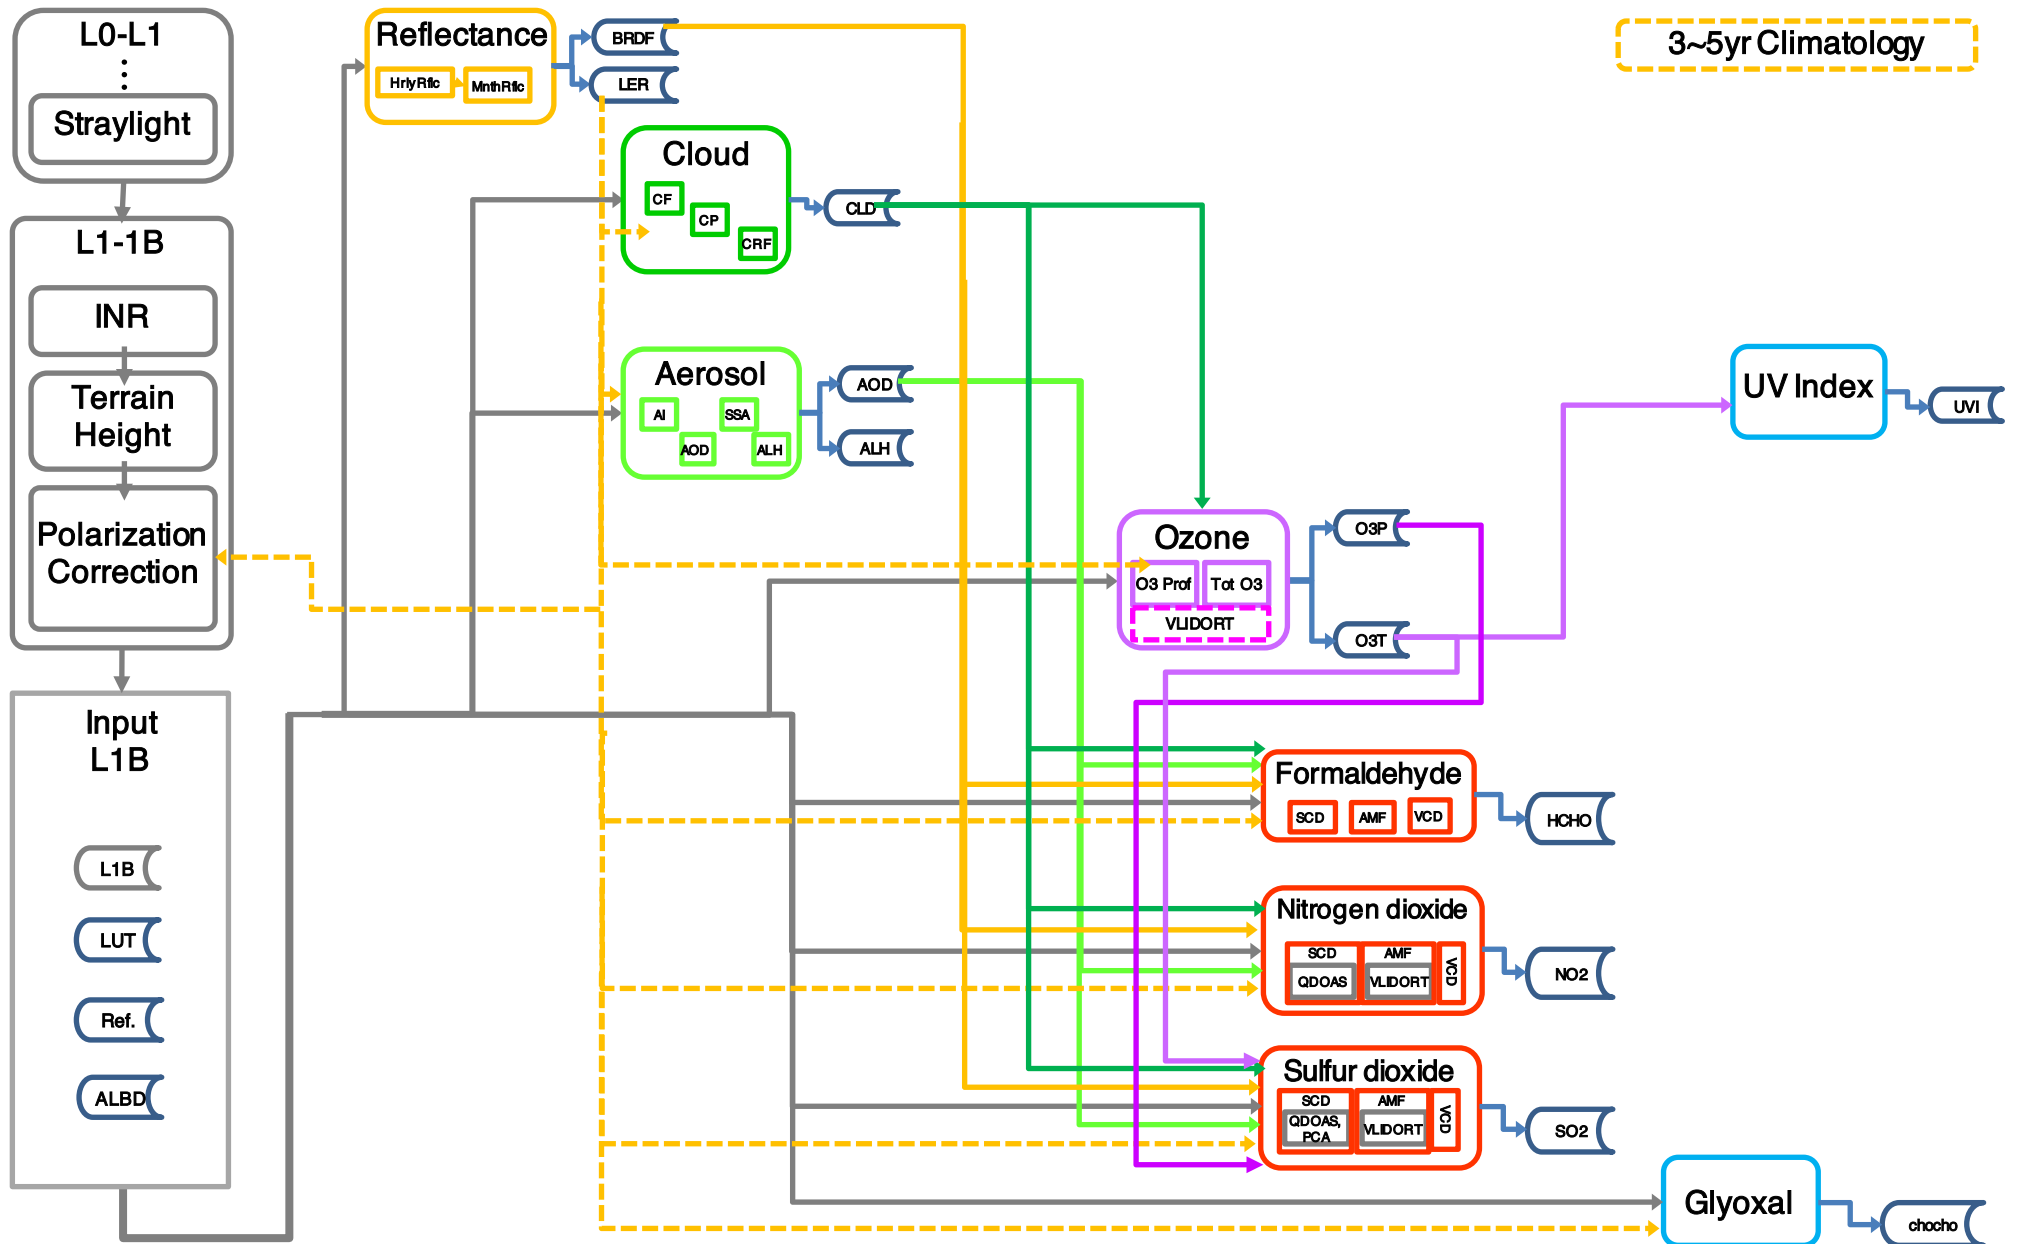

Reduce stray light matrix size 10^{12} to 10^7 by selecting the center pixel of each 19×19 pixel box

(Courtesy, Mijin Eo and M.H. Ahn)

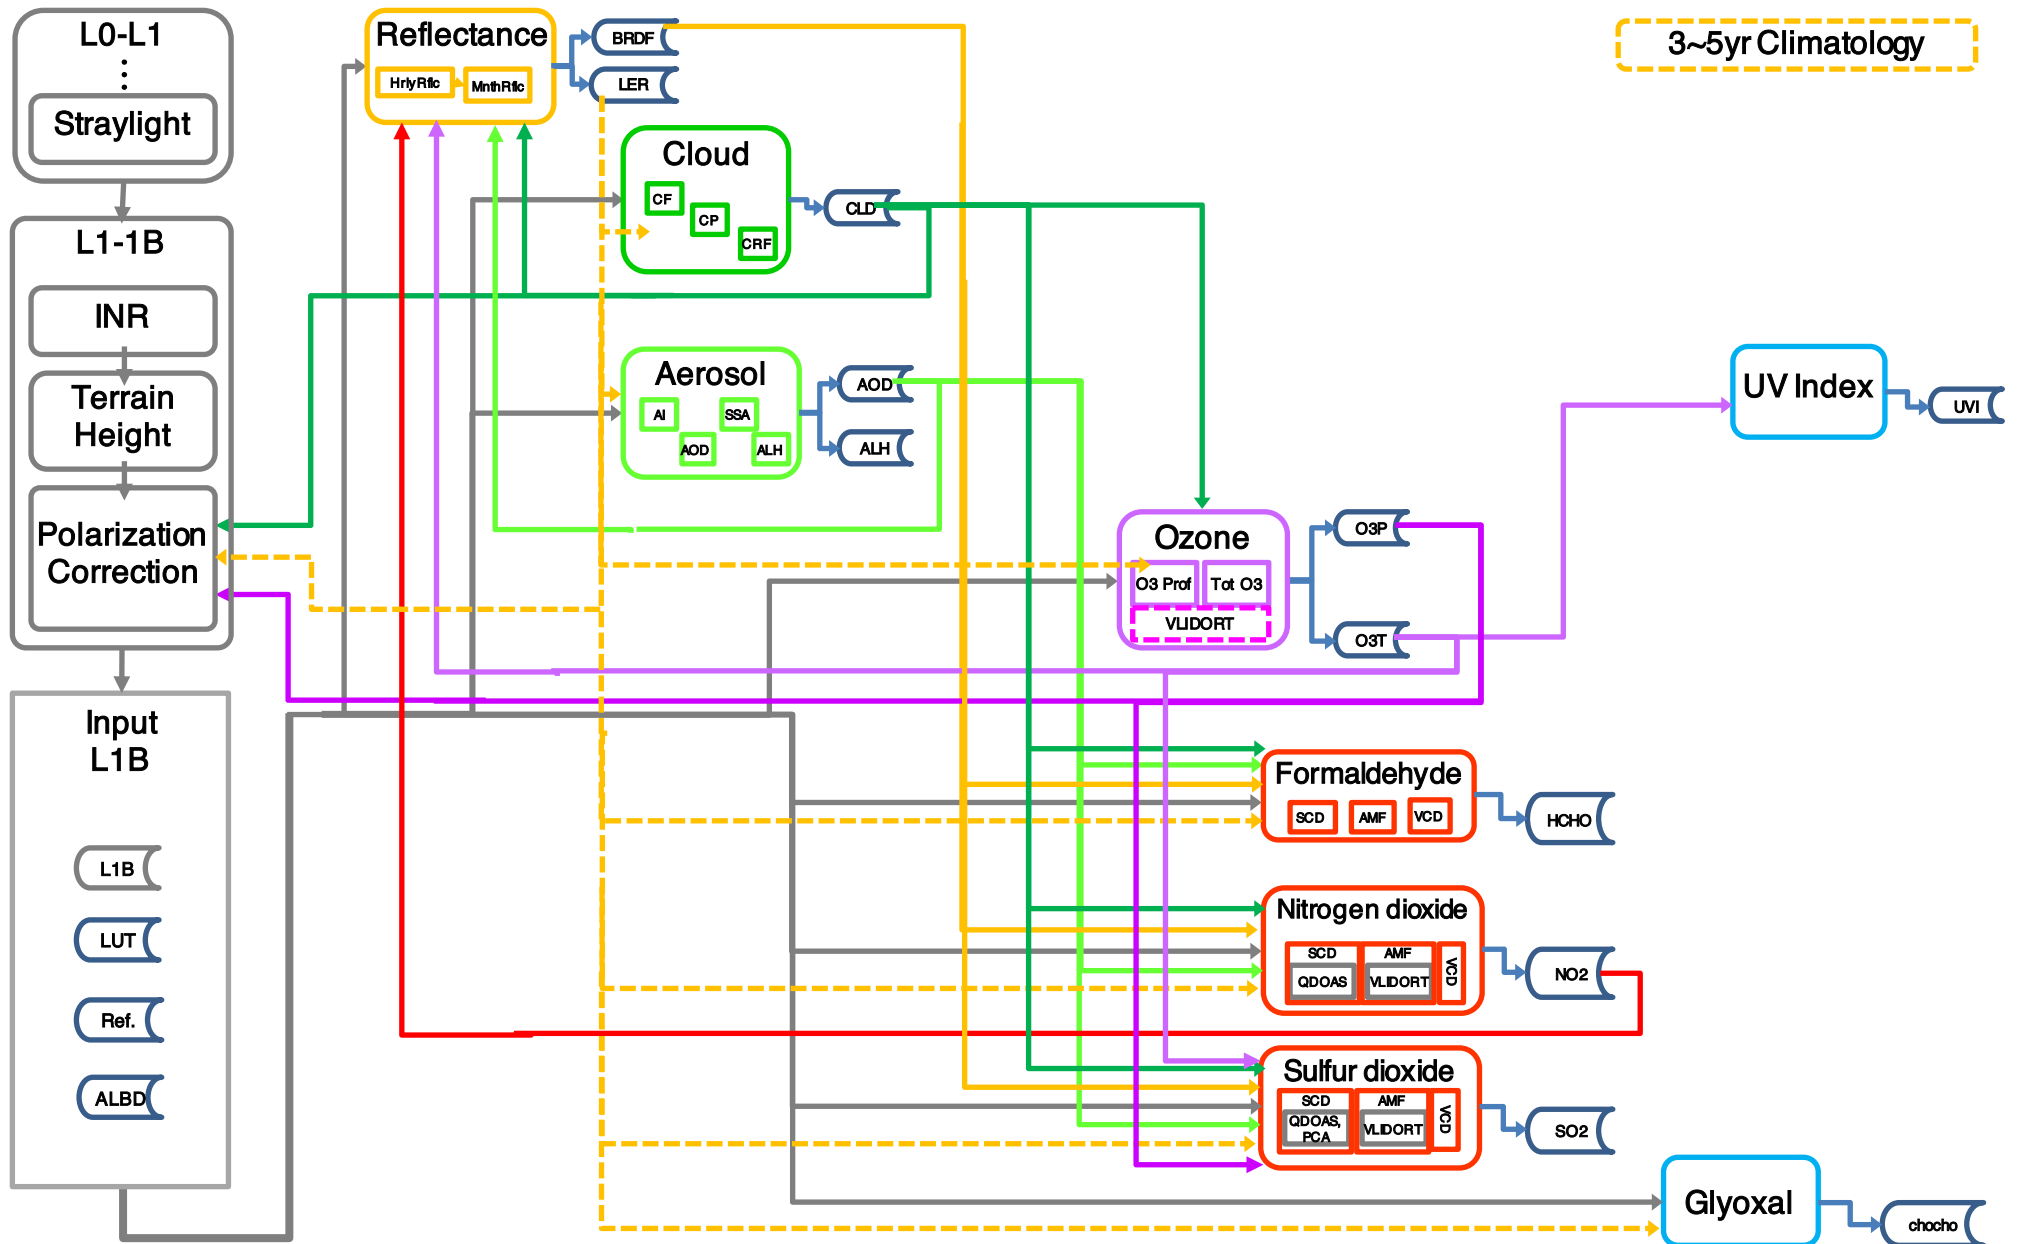

Polarization Factor

- Polarization factors are shown below for the characterization dataset provided by BATC.
- Instrument polarization modeling is required to scale the ground test measured results to the range of GEMS on-orbit scan mirror angles.

GEMS Ground Station at NIER

- Building to be completed soon
- Receiving and processing system to be installed by 2018

Summary

- GEMS flight model has been delivered to KARI after PSR on Jan 26th, 2018. The launch window for GEMS is Sep. 2019– Feb. 2020.
- First version of L0-1 algorithms are delivered but lack of correction for straylight, polarization, spectral calibration etc. which needs further improvements.
- L1b-2 algorithm for gases and aerosols show reasonable performances, but requires persistent improvement, including polarization, hourly retrieval in AMF, S/T separation etc.
- Preflight test results to characterize stray light, polarization, spectral accuracy, diffuser BTDF, dark current etc. can provide more accurate analysis on the GEMS performance and L2 algorithm.
- Synergy with AMI and GOCI-2 will provide more reliable products of aerosol and cloud products, which eventually improve the accuracy of trace gas column density.

GEMS at KARI, finally !
