GEOPHYSICAL-PARAMETER RETRIEVALS OF ISRO MISSIONS

MISSIONS/PROGRAMMES

Missions

- ❖ INSAT-3D/3DR SATELLITES
- ❖ GISAT
- ❖ SCATSAT
- ❖ Oceansat-1/2/3
- ❖ MEGHA-TROPIQUES
- ❖ IRNSS/GNSS
- ❖ TSU/HSU
- ❖ MOP3 & TDP(Projects)
- ❖ NISAR/RISAT
- ❖ FUTURE/ OTHER MISSIONS

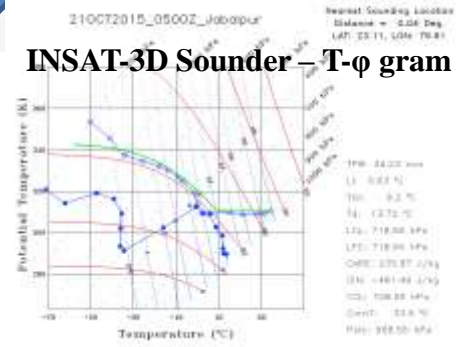

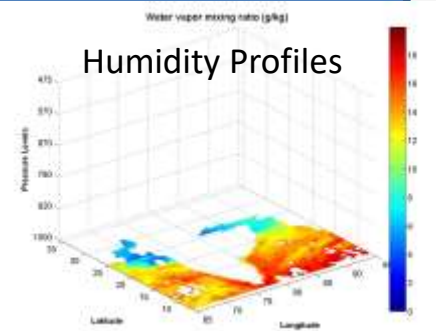

- Activities pertain to
- Simulations
 - Sensitivity studies
 - Algorithms development
 - Operational retrievals
 - Calibration – climate quality
 - Quality evaluation / Validation
 - Value-addition
 - Process studies
 - Applications

➤ Major Work Involvements in Recent Past

Imager: SST, Rain, UTH, OLR, TPW, Fog, CSBT

Sounder: T, WV, O₃ profiles, Total O₃, TPW, Cloud Products, Other Thermodynamic Products

SAPHIR: RH Profile

SAPHIR: Rain

MADRAS: TPW, CLW, OWS & Rain

ROSA: T & RH Profiles

- Bayesian-rain

MT-SAPHIR using Bayesian algorithm.

Future Missions

- Algorithm development for Met/Ocean parameters from
 - **Oceansat-3, GISAT, TSU/HSU, and PMR**
- Inclusion of sounding over cloud top from 3D/3DR sounder
- Sensor definition studies for future EO Missions, i.e., 4th Gen-INSAT, Microwave Radiometers, Soil moisture/Salinity missions,
- Cloud-cleared radiances for partially cloudy pixels
- GNSS Reflectometry for sea surface wind retrieval

Humidity retrieval from Multispectral and Hyperspectral Sounder

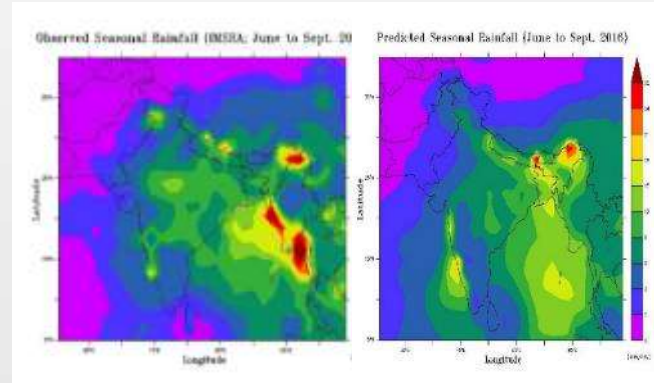

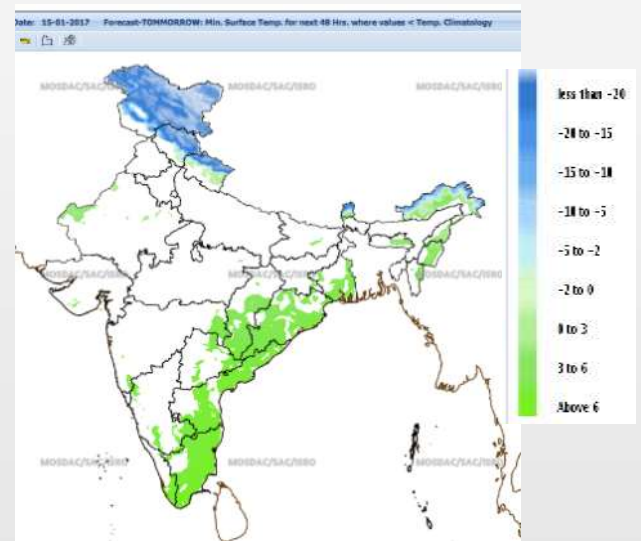

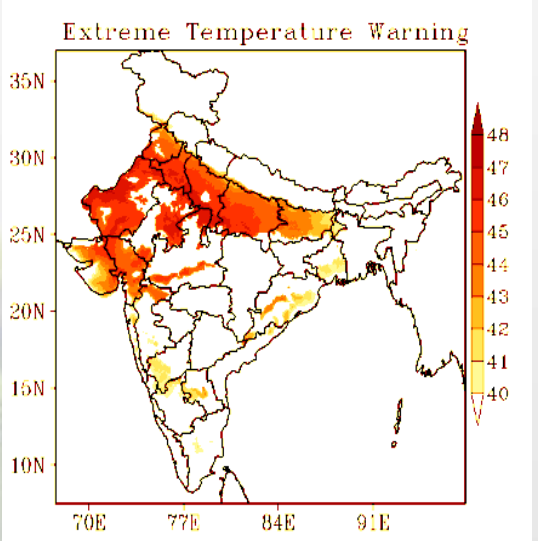

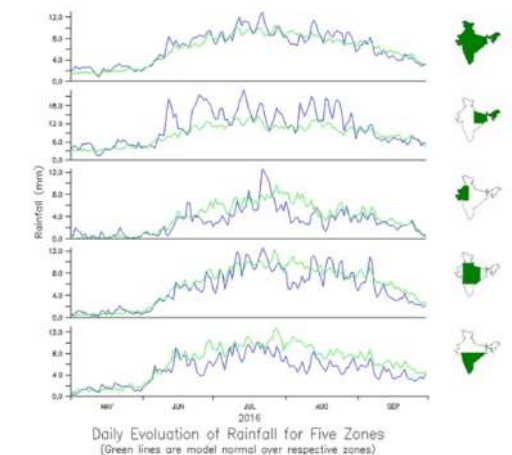

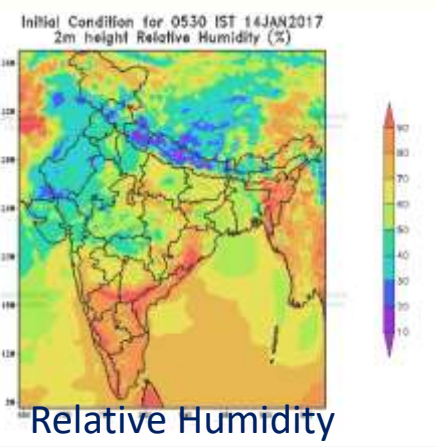

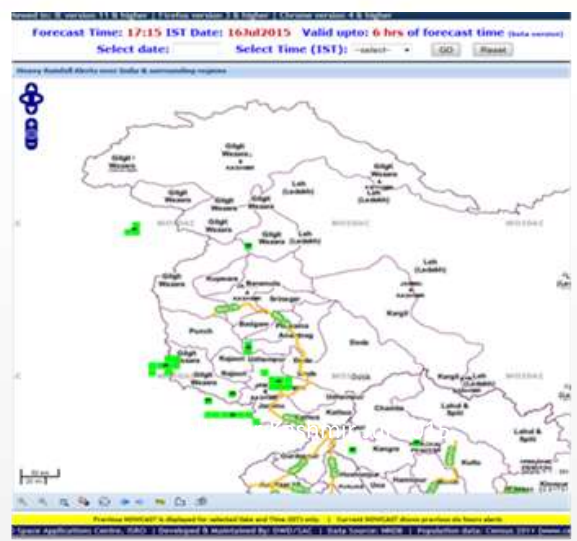

Weather Prediction using satellite data

Short Range Weather Prediction WRF model with 3DVAR

Monsoon Prediction

Comparison of predicted seasonal monsoon rainfall for 2016 with the satellite observations

Cloudburst Alert over Pithoragarh, 01 July 2016

Prediction of heat wave conditions.

Prediction of cold wave conditions

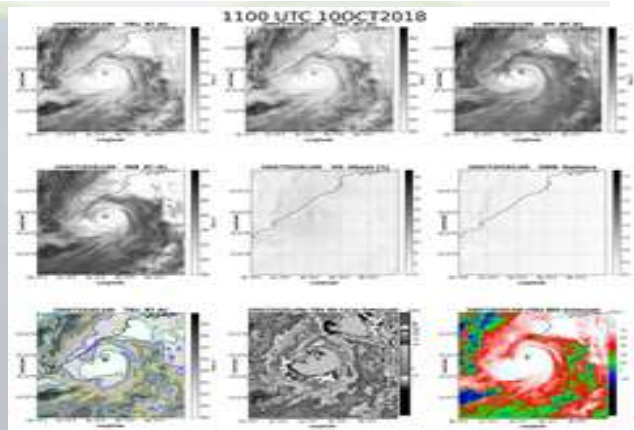

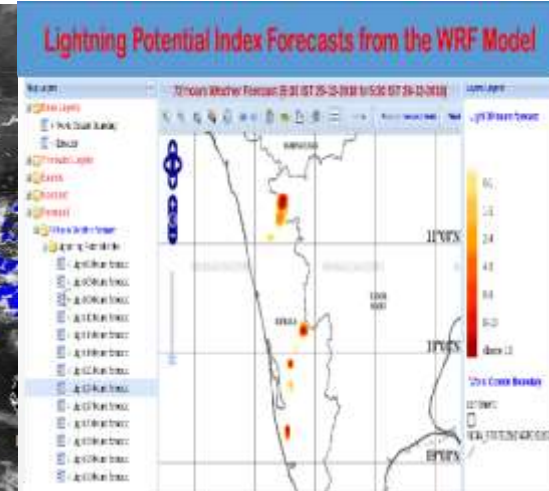

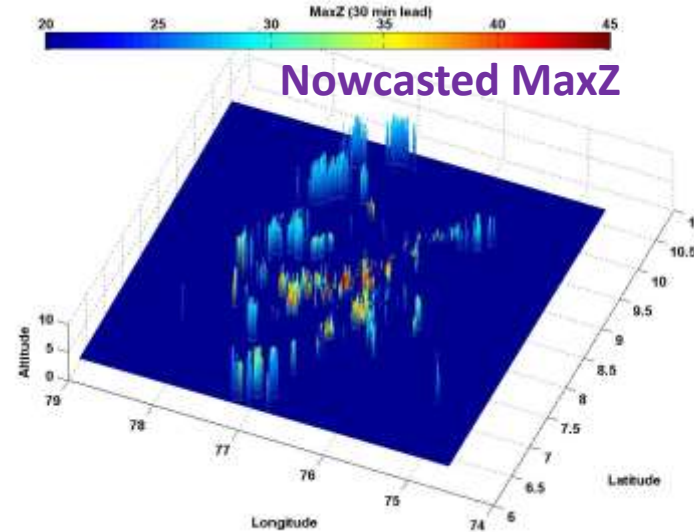

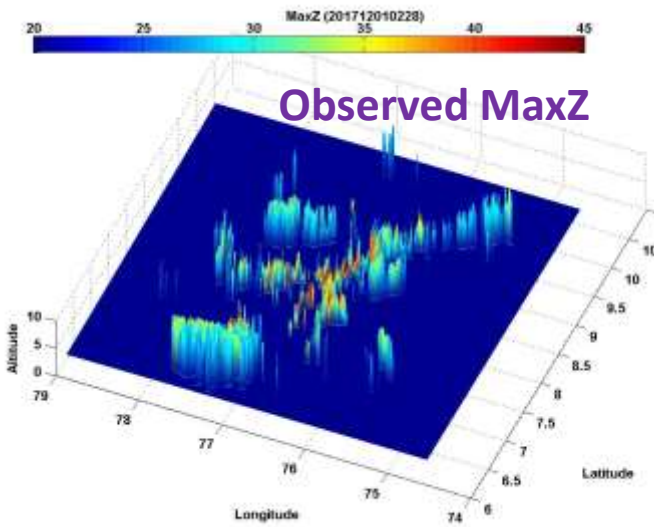

High Impact Weather Events: Satellite and Radar based storm tracking, Nowcasting and cloud microphysical studies

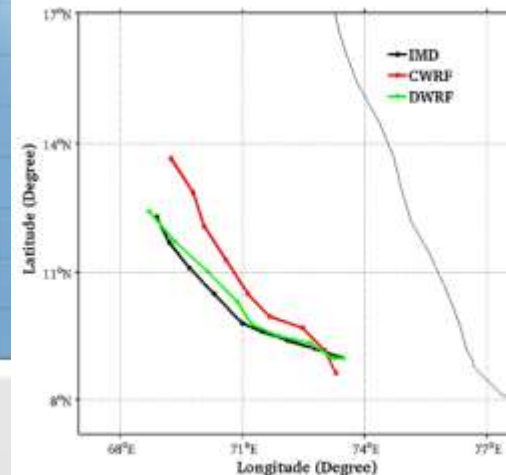

❖ Algorithm development for Doppler Weather Radar (DWR) image processing and its application to storm tracking

Lightning Activities: Using INSAT, GPM and WWLLN Data

Assimilation of ISRO TERLS DWR data on TC Ockhi

Aerosol Effect on Cyclone

Cyclone centric images from different channels of INSAT-3D

Ship avoidance region guidance during TC LUBAN

Hurricane IRMA Observed by SCATSAT

Urban Heat Island Observed by INSAT 3D

Air Temperature (°C) over Ahmedabad
0000 UTC 06MAY2017

Nowcasting & Short-range Prediction of Mumbai Heavy Rainfall
28-29 Aug 2017

High resolution urban surface temperature monitoring and prediction using INSAT-3D/3DR

INSAT-3D/3DR Clear-Sky radiances for assimilation in global weather prediction model at NCMRWF for improved weather prediction

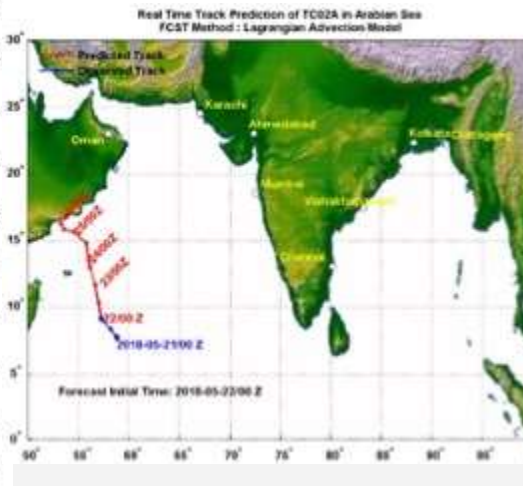

Real-Time Monitoring and Prediction of TC MEKUNU (Active in Arabian Sea)

Cyclogenesis Prediction

Genesis Prediction: 16 Z, 19 MAY
Cyclone formation: 18 Z 22 MAY
Lead prediction time: ~72 hours

Cyclone Track Prediction

Real-time cyclone Track prediction at 00 during 22 and 23 MAY using in-house developed SAC-Lagrangian track prediction model.

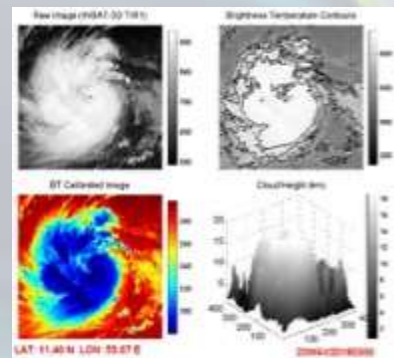

Cyclone Intensity Prediction

Real-time cyclone intensity prediction using NCEP-operational HWRF model Forecasts

Center Estimation

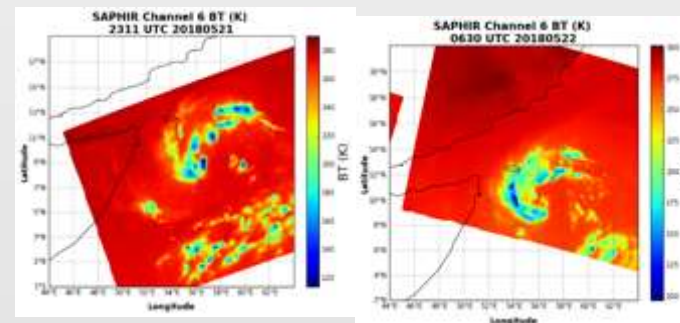

Real-time TC center was estimated and TC centric products were generated using INSAT-3D Imager data

Cyclone centric satellite Products Generation

INSAT-3D Imager

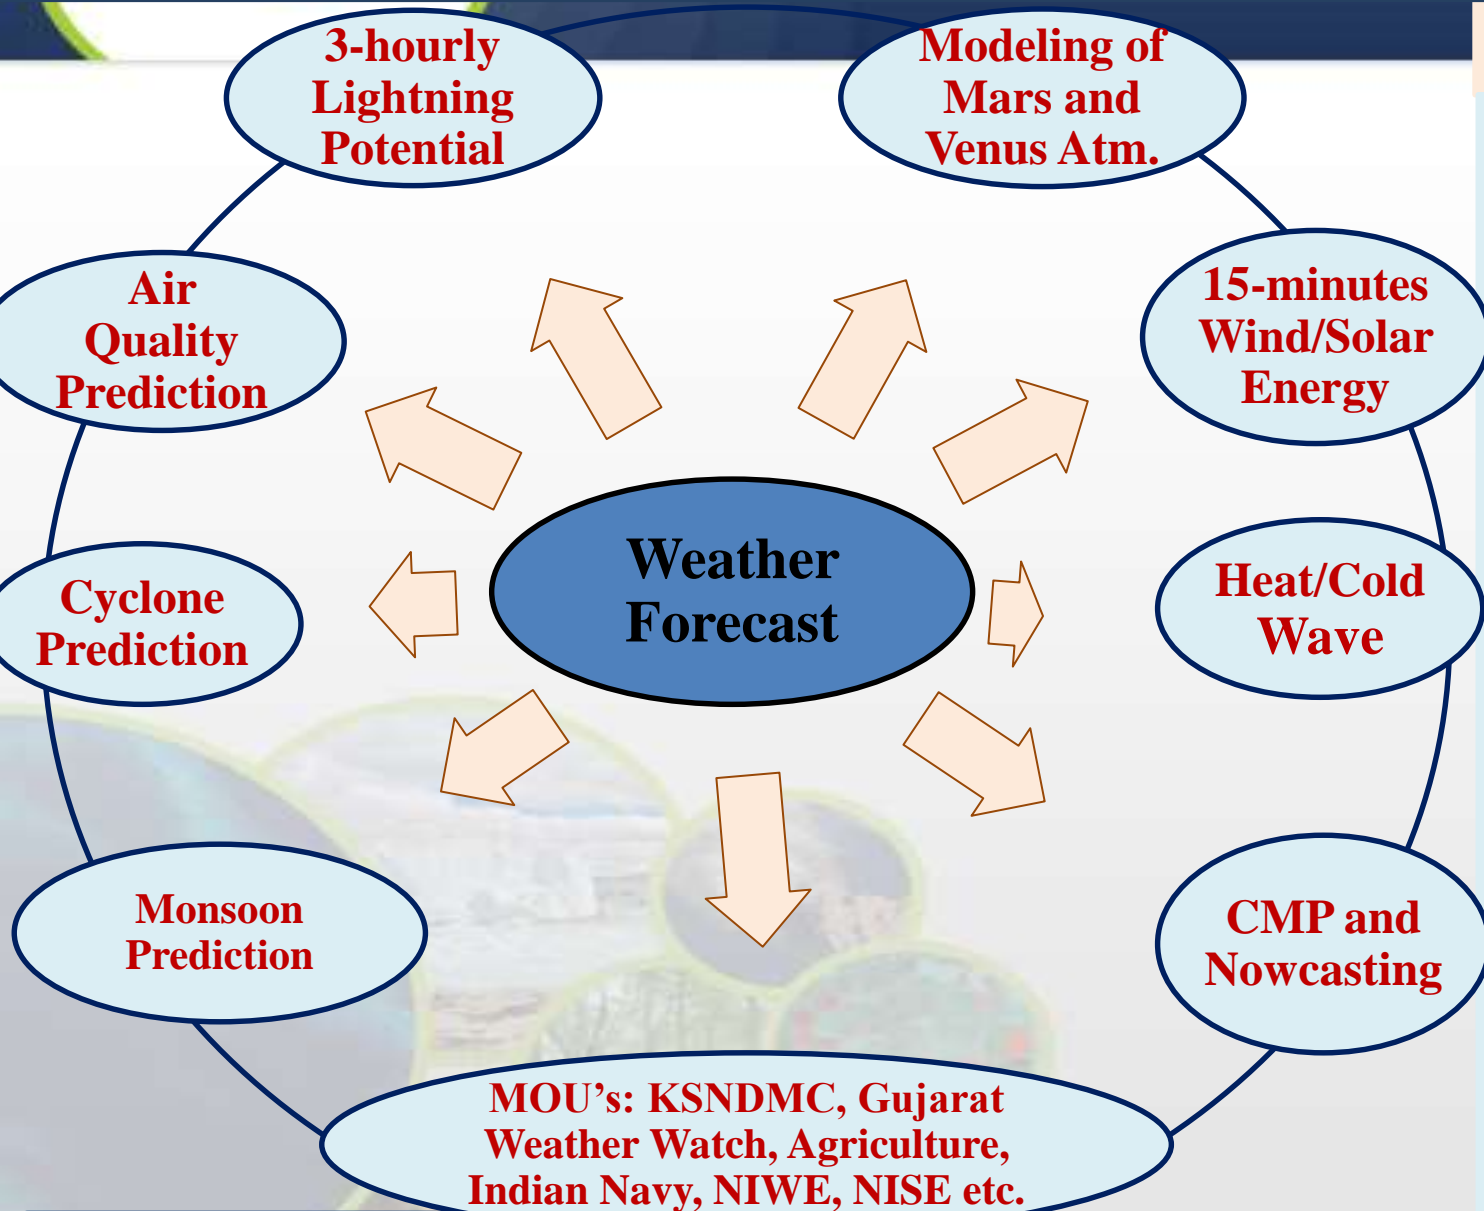

MT-SAPHIR

SCATSAT-1

Atmospheric Sciences : Weather Forecasting and Data Assimilation

Research Activities

- All-Sky Assimilation of SAPHIR radiances
- Development of assimilation system for INSAT-3R radiances
- Assimilation of ISRO TERLS DWR for extreme weather events
- Development of assimilation system for Martian & Venusian Atmosphere
- Seasonal forecast using CESM Model
- Lightning Estimate and Forecasting

Scope & Objectives

- Identification of zones which are susceptible to extreme conditions using site specific wave and circulation models.
- Provide outlook of potential fishery zones; development & demonstration of FISHTRACK module
- Generation of very high resolution ocean state for Naval and Shipping operations
- Tracking of oil spill; development & demonstration of OILTRACK module
- Identify potential zones for wind, wave and thermal energy
- Synthetic temperature and salinity profile generation using satellite observations
- Optimize model parameters for better mixed layer simulation.
- Development of improved algorithms for momentum, latent and sensible heat flux computation using satellite and in-situ measurements.

Targeted Outcomes

Marine Ecosystem, Potential Fishing Zones

Ocean Hazards (RIP currents, extreme waves, oil-spill forecasting,)

Energy Sector (wind/wave/thermal)

Oil Exploration, Naval Operations & Ship Routing

New Sensor Definition / Retrieval / Infrastructure / capacity building

Disaster Monitoring and Prediction

Ocean Reanalysis , accurate models for OSF

Ocean observing systems for satellite cal-val and model optimization

Satellite based new methodology for identifying PFZ locations (in blue lines)

OIL-TRACK

SAMUDRA: Coastal Inundation Forecast for 10/10/2018, 0600 GMT associated with TITLI (Forecast generated on 09/10/2018, 0600 GMT) Validation to be done and plan to host it on MOSDAC

Simulated Coastal Inundation Forecast for Titli Cyclone upon Landfall on 10/10/2018 06:00:00 IST

RIP CURRENTS

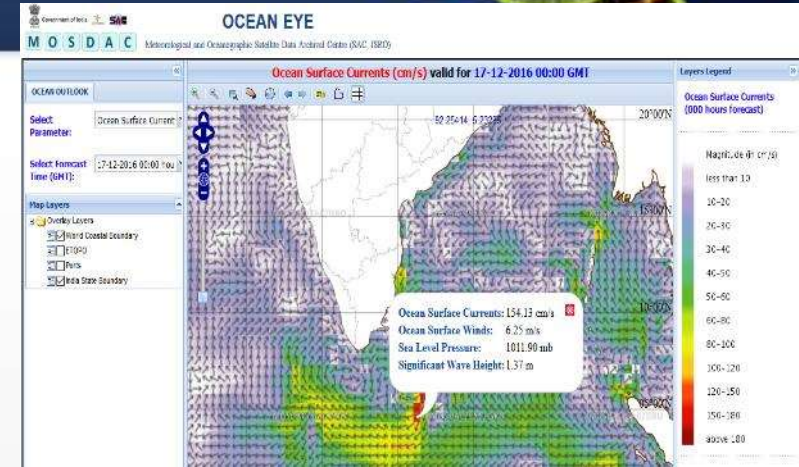

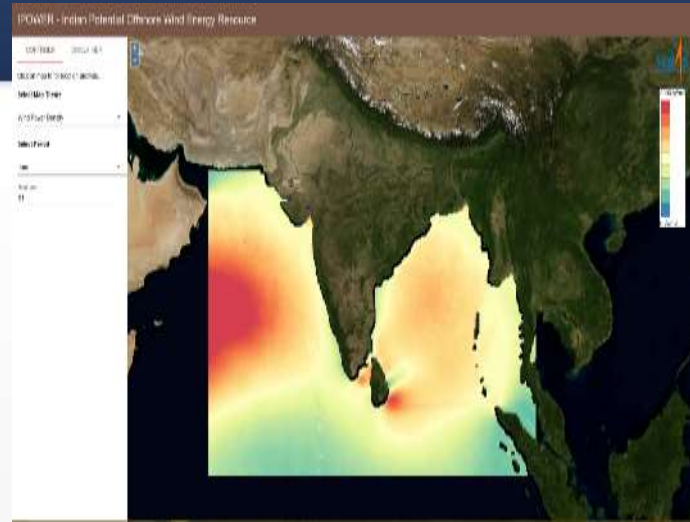

Rip current hotspot detection from satellite RS

iPOWER hosted on VEDAS

Ocean Eye (MoU with SCI)

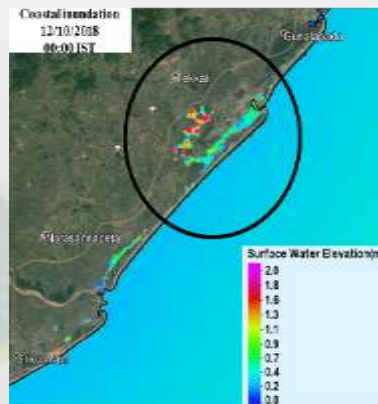

Rip current measurements from low-cost GNSS drifters

Coastal inundation forecast for TITLI cyclone (left); Validation using RADARSAT image (right); Operationalized on MOSDAC

Sub-surface projection of Density Anomaly (blue to orange in increasing order of its value) from satellite parameters (sea level, sea surface temperature and surface salinity)

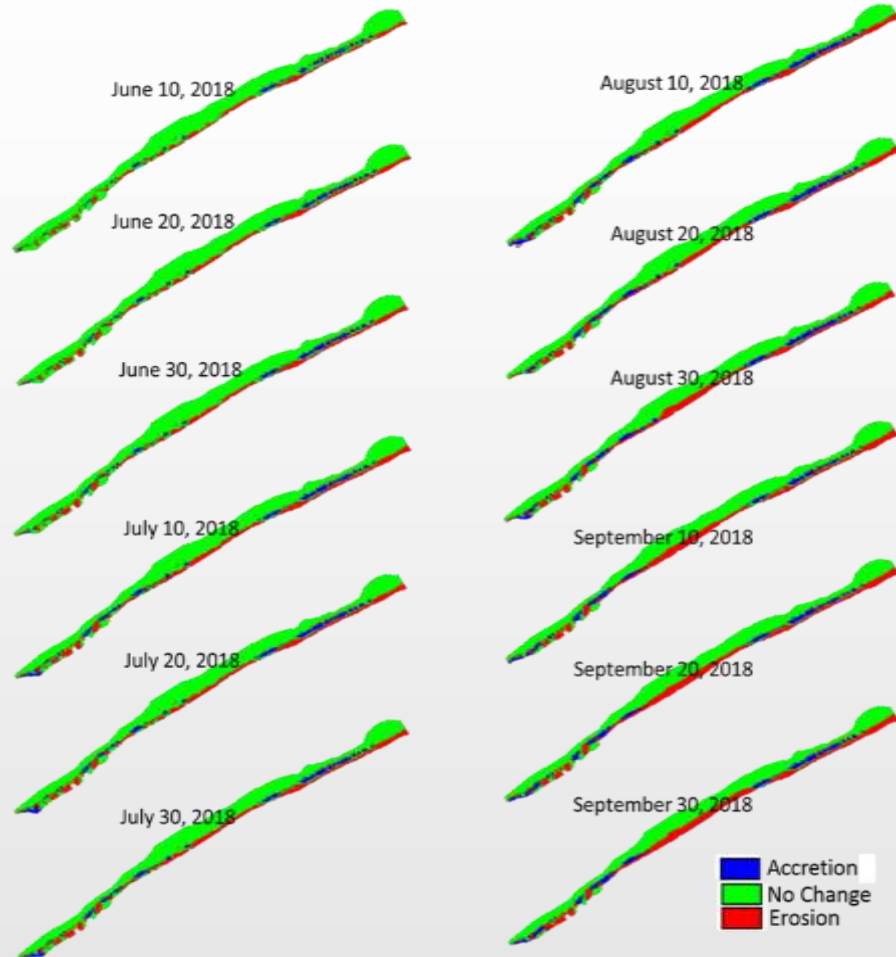

Beach Erosion Forecast

- Initial conditions using DGPS profiles at every 5 m interval along 4 km beach. Morphodynamic model is simulated using forecast wave parameters.

- Beach erosion forecast/advisories are provided in a test mode for monsoon season, 2018 all with a lead period of 10 days.

Beach Erosion Advisory (lead period of 10 days)

Validation of Beach Erosion Forecast

Work is planned for operational beach erosion forecasting system for selected beach with INCOIS

Ocean Modelling (wave, circulation, biogeochemistry and coupled): AOSF

(Multi-nested interactive modelling set-up)

Motivation:

- Observing System Simulation Experiment (OSSE): Defining the Future Ocean Sensors
- High Resolution Site/Event – ISRO's Satellite Recovery Program
- Naval and Shipping Needs
- Development of Model : Optimising model parameters using non-linear data assimilation Methods

The Road Map

Very high resolution process modelling (~ 100m)

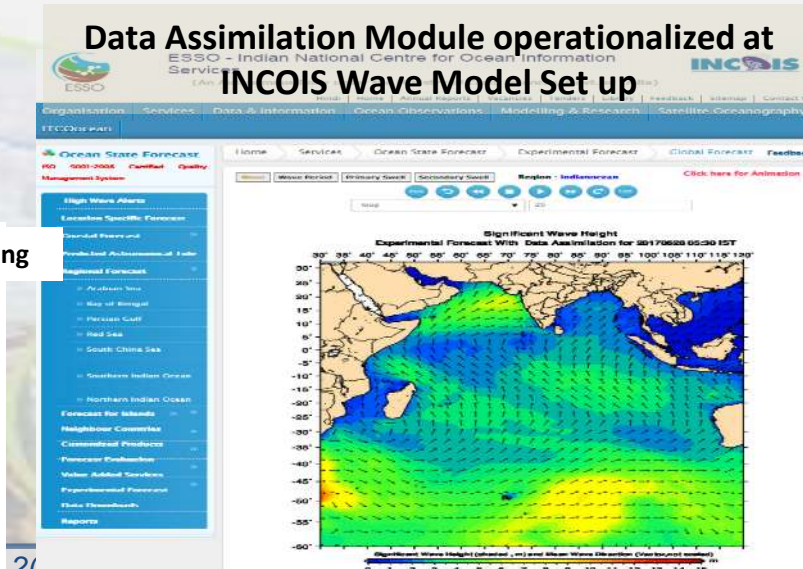

R&D Components:

- Assimilation of sea level (altimeter obs), currents, SST, SSS & Argo Profiles (T & S), ocean color--- **A complete assimilation package**
- HR-Satellite image assimilation (GISAT & SWOT)

Coupled Bio physical modelling

Data Assimilation Module operationalized at INCOIS Wave Model Set up

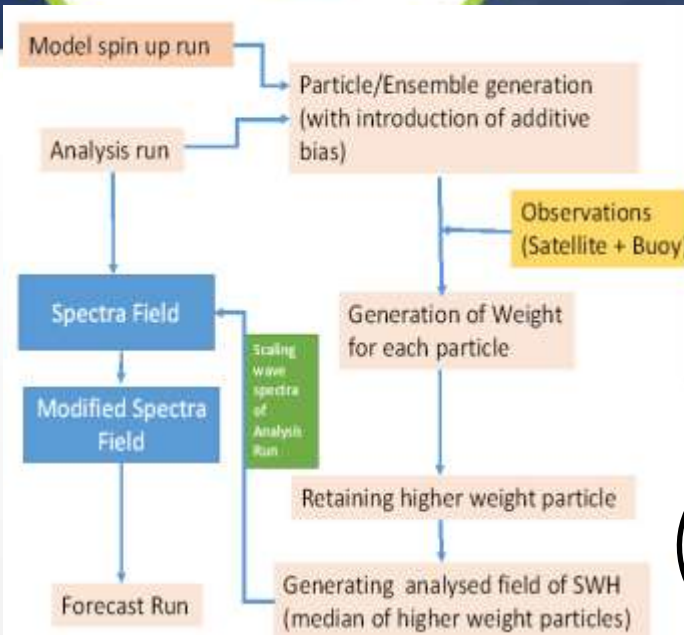

Coupled ocean atmosphere modelling for El-Nino forecasting

- Forecast generated using initial conditions of April, May and June
- 6 month lead time forecast for December 2017 predicted neutral conditions in the Pacific.

El-Nino Forecast for December 2018 using coupled ocean-atmosphere model : **Mild El Nino**

Development of Particle Filter based assimilation scheme for wave model incorporating altimeter and Indian ocean buoy

The SWH over Bay of Bengal on 31st July 2016 at 00:00 GMT from a) Analyzed field and b) Control field with overlaid SWH from altimeter tracks.

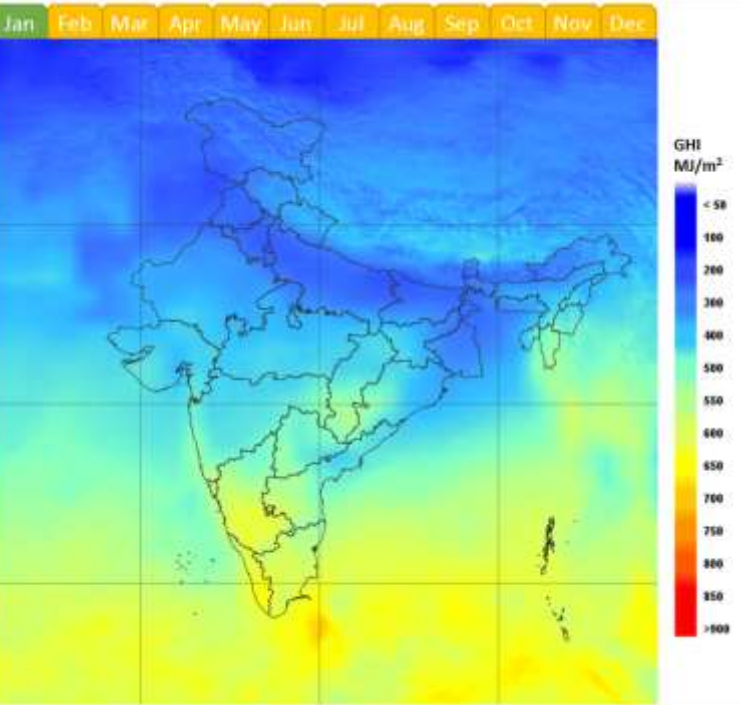

The SWH over Bay of Bengal February and July 2016 from various runs. Alt-J2,J3,SRL/ALTIKA BUOY: INCOIS BD buoys no 11, 8 and 14

Future plans:

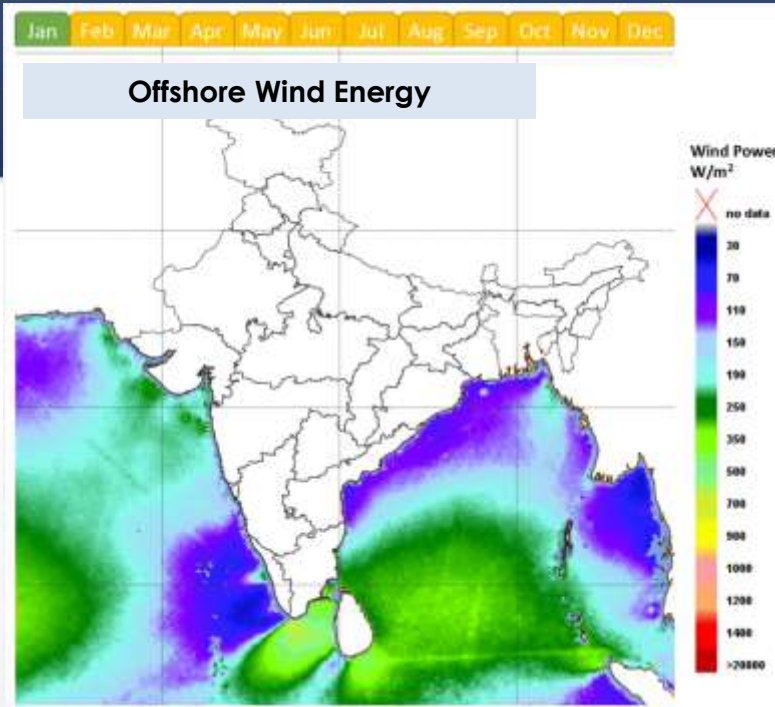

1. Climatological run using particle filter assimilation technique in progress. This is for generation of high resolution BOB wave assimilation based reanalysis product and would incorporate all BOB buoys/ altimeter data

How Urbanization is affecting the rainfall, mainly the Heavy Rain Events

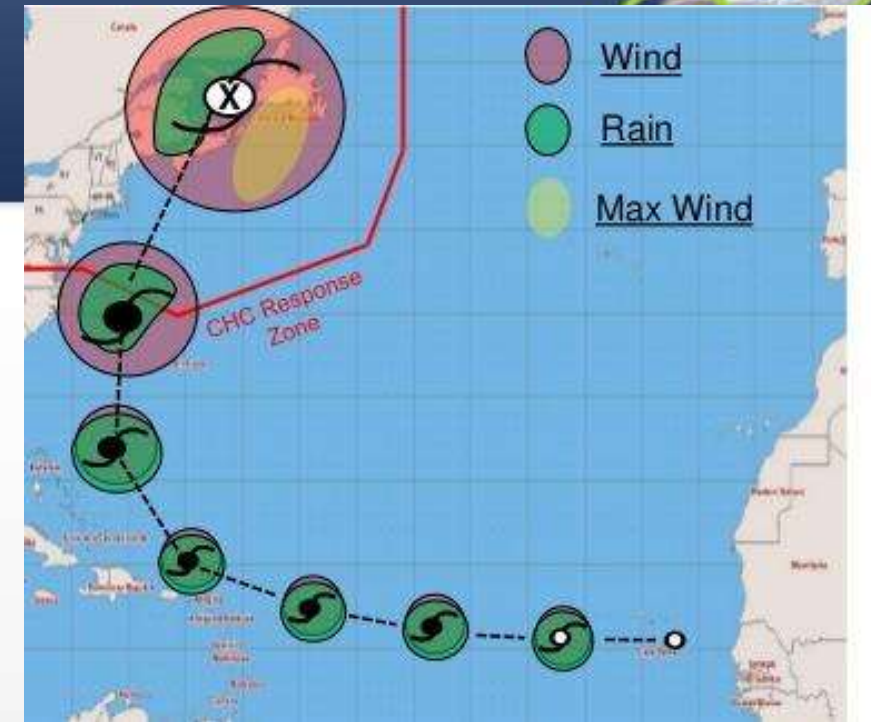

Satellite observations from recent years also confirm that urban areas (indicated by high density of population) have higher (almost twice as high) proportion of heavy rainfall events compared to rural areas.

During past 5 decades, there have been a significantly increasing trend in heavy rainfall events over urban areas during monsoon.

How global climate change has affected the tropical cyclone behavior ?

Tropical cyclone intensification trends during satellite era (1986–2010)

C. M. Kishtawal,¹ Neera Jaiswal,¹ Randhir Singh,¹ and D. Niyogi²

Received 14 March 2012; revised 17 April 2012; accepted 19 April 2012; published 26 May 2012.

[1] Using International Best Track Archive for Climate Stewardship (IBTrACS, version v03r03) analysis during satellite era (1986–2010) we determined the trends of intensification of tropical cyclones (TC) over all the global basins, except the North Indian Ocean. Over all the basins, the rate of TC intensification from 64 kt to first peak of intensity maxima (global average value = 104 kt) was found to be positive. The above trends were significant for 4 out of 5 basins, except the North West Pacific. The trends indicate that the TCs now intensify from 64 kt to 104 kt nearly 9 hours earlier than they did 25 years back. The maximum reduction in intensification time is noticed over the North Atlantic Ocean where the average time needed for TC to intensify from 64 kt to 112 kt has reduced by nearly 20 hours during the past 25-year period. Citation: Kishtawal, C. M., N. Jaiswal, R. Singh, and D. Niyogi (2012), Tropical cyclone intensification trends during satellite era (1986–2010), *Geophys. Res. Lett.*, *39*, L10810, doi:10.1029/2012GL051700.

of the strongest tropical cyclones. Theory suggests that a rise of 1°C in SST can indeed result in ~4–5% increase in TC maximum sustained wind speed [Emanuel, 2005] but some researchers are skeptical about whether such small trends can be detectable at all [Landsea et al., 2006]. For example, study by Balling and Cerveny [2006] showed no significant trends in TC intensification rates over the Atlantic during 1970–2003. Similarly Klotzbach [2006] has shown the absence of any linear trend in the cyclonic activity during the recent 20 year (1986–2005) period. The period after 1985 has specific significance in TC research because most of the operational meteorological centers started to use satellite-based observations for TC detection and more importantly the TC intensity analysis based on the Dvorak technique [Dvorak, 1984, 1995] that used infrared satellite images [Knaff et al., 2010].

[1] Detection of climatic trend of severe cyclonic activity from such a small record of reliable observations can be done only after successfully addressing issues related to the data

- A Study carried out at SAC concluded that the global warming has enhanced the **rate of cyclone intensification** in most of the global basins.
- The rate of cyclone intensification was found to be largest in the Southern Indian Ocean followed by North Atlantic Ocean.
- In some basins (like North Atlantic) now it takes a cyclone about 24-hour less time to intensify from severe cyclone to super cyclone, than it did 25 years ago.
