5 Conclusion and perspectives

Context

Ship detection SAR and AIS Deep learning Objectives

Dataset

Framework

Results

Conclusion and perspectives The detection of inshore and offshore ships is an important issue:

- Monitoring fisheries,
- Managing maritime traffic,
- Ensuring safety of coast and sea.

In operational contexts, ship detection is traditionally performed by a human observer from **visual analysis** on remotely-sensed images. It is very **time consuming** and cannot be conducted at a very **large scale**.

SAR images

Context

Ship detection SAR and AIS Deep learning Objectives

Dataset

Framework

Results

Conclusion and perspectives Sentinel-1 SAR data provides regular, worldwide coverage.

Almost all coastal zones and shipping routes are covered by Interferometric Wide Swath Mode (IW), while Extra-Wide Swath Mode (EW) acquires data over open oceans, providing a **global coverage** for sea-oriented applications.

AIS

Context

Ship detection SAR and AIS Deep learning Objectives

Dataset

Framework

Results

Conclusion and perspectives The automatic identification system (AIS) is an automatic tracking system that uses transponders on ships.

AIS provides meaningful and relevant information about ships (such as position, **type**, **length**, rate of turn, speed over ground, etc.)

Deep learning

Context

Ship detection SAR and AIS Deep learning Objectives

Dataset

Framework

Results

Conclusion and perspectives Deep learning is considered as one of the major breakthrough related to big data and computer vision.

A Deep Neural Network:

- consists of multiple layers (such as convolution, pooling, fully connected and normalization layers),
- transforms original data (raw input) into higher semantics representation,
- can learn very complex functions.

Objectives

Context

Ship detection SAR and AIS Deep learning Objectives

Dataset

Framework

Results

Conclusion and perspectives Employ the synergy of SAR and AIS in order to detect and characterize ships:

- Detect ships on SAR images.
- Estimate ship length from SAR images.
 - Could not be directly retrieved from ship footprint from SAR images.
- Classify ships from SAR images.

Dataset

Framework

Results

Conclusion and perspectives The dataset is composed 18,894 SAR images of size 400×400 obtained by coupling AIS information and SAR data:

- Each image is accompanied with the incidence angle
- \rightarrow cropping to reduce the size to 80×80 and preserve significant contextual information while reducing the amount of data to process.
 - 5 classes (Tanker Cargo Fishing Passenger Tug)
 - Unbalanced database (10,430 instances of Tanker and only 1,071 instances of Passenger)

 $\rightarrow\,$ data augmentation with translations and rotations.

Final dataset:

• Balanced dataset, 20,000 images 80×80 .

CEOS WGISS-47

Framework

Context

Dataset

Framework

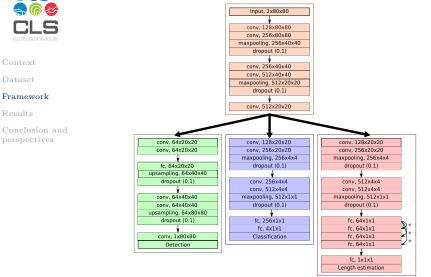

Results

Conclusion and perspectives The proposed multi-task framework is based on two stages inspired from the VGG framework:

- a first common part,
- three task-oriented branches for ship detection, classification and length estimation.

Model

Loss function - detection

Context

Dataset

Framework

Results

Conclusion and perspectives Detection loss (binary cross-entropy):

$$L_{det} = -\frac{1}{N} \sum_{n=1}^{N} \sum_{k \in I} (y_k \log(p(k)) + (1 - y_k) \log(1 - p(k)), (1)$$

with y_k : ground truth of ship presence (0 or 1) of pixel k and p(k) probability of ship presence of pixel k.

Allows to provide a probability map of ship presence.

Loss function - classification

Classification loss (categorical cross-entropy):

Dataset

Framework

Results

Conclusion and perspectives

$$L_{class} = -\frac{1}{N} \sum_{n=1}^{N} \sum_{c=1}^{n_c} (y_{o,c} \log(p_{o,c})), \qquad (2)$$

with $y_{o,c}$ a binary indicator (0 or 1) if class label c is the correct classification for observation o and $p_{o,c}$ the probability for the observation o to belong to c.

Allows to provide the class probability for each input image.

Loss function - length estimation

Context

Dataset

Framework

Results

Conclusion and perspectives Length estimation loss (mean squared error):

$$L_{length} = \frac{1}{N} \sum_{n=1}^{N} (l_{pred} - l_{true})^2, \qquad (3)$$

with l_{pred} the predicted length and l_{true} the true length.

Allows to minimize the error of ship length.

Loss function

The loss function for the network is:

$$L = L_{det} + L_{class} + L_{length}$$
(4)

Framework

Conclusion and perspectives

- Each specific loss employed to design the loss of the whole network could have been weighted.
- $\rightarrow\,$ The range is not uniform among the different losses but it appears to have no effect on the optimization process.
 - Each specific loss is equally weighted.

Training

Context

Dataset

Framework

Results

Conclusion and perspectives Network trained on a PC with a single NVIDIA GTX 1080 Ti, an Intel Xeon W-2145 CPU 3.70GHz and 64GB RAM.

- Dataset splitted:
 - 16,000 samples for training,
 - 4,000 samples for testing.
- Training the model with 800 epochs and batches of 100 samples.
- Training takes about 9 hours.
- Testing takes less than a minute.

Results Detection Classificatio

Length estimation

Conclusion and

The length estimation is well performed by our network:

- 4 classes: mean error: $4.65 \text{ m} \pm 8.55 \text{ m}$
- 5 classes: mean error: $\mathbf{1.93}\,\mathbf{m}\,\pm\,\mathbf{8.8}\,\mathbf{m}$

The mean error is in both cases lower than the resolution of the image and the standard deviation is also very low.

Comparison

Conclusion and perspectives **Length estimation** - comparison with a MLP with one hidden layer having 128 hidden units.

Comparison with other networks

 $\begin{tabular}{|c|c|c|c|c|} \hline Our network & MLP \\ \hline Mean error & {\bf 4.65 m \pm 8.55 m} & -7.5 m \pm 128 m \\ \hline \end{tabular}$

Classification - comparison with the MLP and a RCNN.

	Our network	MLP	RCNN
Overall $accuracy(\%)$	97.25	25.00	88.57

26/29

Conclusion

Context

Dataset

Framework

Results

Conclusion and perspectives The ship detection has been widely investigated, a ship probability presence map has been proposed using a deep neural network.

The proposed framework has shown **very good results in terms of classification**. Some light confusion with the *Cargo* class was reported.

The length estimation achieves a **sub-pixel error and standard deviation**.

Perspectives

Integration of iceberg detection
