

# Surface PM2.5 and AOD Data assimilation Status update from the Global CAMS system

*Johannes Flemming, Melanie Ades, Antje Inness, Enza Di Tomaso, Sebastien Garigues, Samuel Remy (HYGEOS)*

Atmosphere  
Monitoring

## WHAT IS THE SCOPE OF CAMS?

CAMS provides **consistent and quality-controlled** information related to air pollution and health, solar energy, greenhouse gases and climate forcing, everywhere in the world.

Air quality

Policy tools

Solar energy

Ozone layer and UV radiation

Emissions and surface Fluxes

Climate forcing

Data assimilation

PROGRAMME OF  
THE EUROPEAN UNION

IMPLEMENTED BY

- ECWMF's Integrated Forecasting System (IFS) with modules for data assimilation and simulation of aerosols and reactive gases
  - 00 and 12 UTC forecast over 5 days at 40 km resolution (TL511|137)
  - Data assimilation of satellite retrievals for AOD, CO, Ozone and NO<sub>2</sub>
  - Anthropogenic and biogenic emissions inventories (CAM5-GLOB)
  - NRT fire emissions from GFAS
- 48r1 update of CAMS o-suite (27<sup>th</sup> of June 2023)
  - Full stratospheric chemistry (BASCOE)
  - New secondary organic aerosols (biogenic and anthropogenic)
- Control forecast (00 only) without DA of atmospheric condition
  - AC IC are taken from the previous day
- CAMS aerosol model has 16 aerosol variables :
  - sea-salt (3 bin), desert dust (3 bin), OM (2), BC (2), SO<sub>4</sub>, NO<sub>3</sub>(2 bins), NH<sub>3</sub>, SOA (2)
  - Coupled to the CB05/BASCOE chemistry scheme

# Aerosol Data assimilation

- Assimilated observations of AOD at 550 nm
  - **MODIS & VIIRS** over ocean and land
  - PMAp (Metop-BC) over ocean only
  - SLSTR from Sentinel 3A/B passively monitored
- 4D-VAR with prescribed background error statistics (NMC)
- Variational Bias Correction (VarBC) for MODIS, VIIRS(SNPP) and PMAp – VIIRS (NOAA-20) is anchor
- Control variable is formulated in terms of the total aerosol and fractional contribution of each aerosol type is maintained in analysis increments
- Challenges of AOD DA:
  - Lack of vertical information in AOD retrieval
  - Lack of aerosol speciation information in AOD retrieval
  - Multi-instrument biases
  - Precision and accuracy of AOD retrieval (clouds, surface albedo, optical properties ...)

## Summary

- PM2.5 and AOD are often (temporally) well correlated at the large scale but there is considerable spread in a pixel-by-pixel comparison.
- Positive impact of DA AOD on analysis and forecast of AOD in CAMS
- Mixed impact of AOD DA on surface PM2.5 (and PM10) in CAMS (beneficial during BB events in North-America in JJA 23)
- Improvements by AOD DA have been reduced over time because of advances in aerosol modelling in CAMS
- GAW-WMO AQF intercomparisons show that modelling differences are main cause for performance differences of regional and global AQF systems
- Way forward:
  - Combined total and dust AOD assimilation is beneficial for aerosol speciation in analysis
  - Experimentation with vertical structure of background error statistics in 4D-VAR
  - Assimilation of AOD and other aerosol retrievals (AE, SSA, AIH) specifically adopted to CAMS aerosols (EU CAMEO project)
  - Preparation for DA for new aerosol satellite retrievals from 3MI and GEMS/TEMPO/S4 (EU CAMEO project) and aerosol lidar backscatter from the upcoming EarthCARE
