SHADOZ=So. Hemisphere Additional Ozonesondes IAGOS = In-service Aircraft for a Global Observing System HEGIFTOM = Harmonization and Evaluation of Ground-based Instruments for Free Tropospheric Ozone Measurements

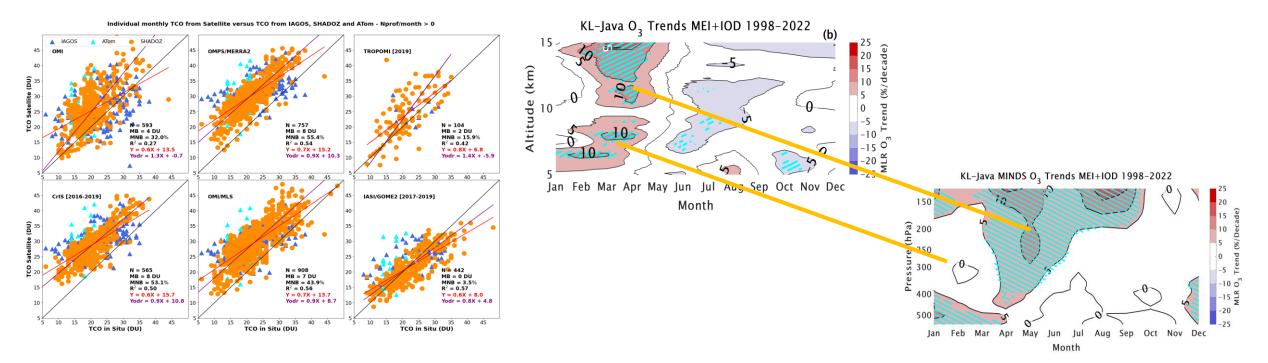

- WHY Is HEGIFTOM (Harmonization and Evaluation of Ground-based Instruments for Free Tropospheric Ozone Measurements) so important in Ozone (TOAR II) & Climate Assessments?
- HEGIFTOM: WHAT, HOW, WHERE. Data Status.
- Present "Total tropospheric ozone column" (TrOC, surface to 300 hPa) trends
  - Focus on 55 station/instrument time-series from 2000-2022
  - Five instrument types with TrOC measurements included in calculations
  - Compare trends by 2 standard statistical methods (QR, MLR)
  - Free Tropospheric (FT) ozone column trends computed (not shown)
- Summary: Trends to date for 2000-2022 show:
  - All sites within <u>+</u> 3 ppbv/dec → equivalent to <u>+(</u>1-8)%/dec, for TrOC, depending on location, <u>and independent of statistical method</u>
  - HEGIFTOM data = \*the\* independent reference for satellite, model evaluation

### Why Does IGAC/TOAR II Need HEGIFTOM?

- Tropospheric ozone (TCO) satellite products (Keppens, next Talk) struggle to match aircraft, ozonesondes, each other! New tropical comparisons (Gaudel et al., 2024 for TOAR II) illustrate noise, varying biases, correlation, r<sup>2</sup> 0.3-0.6 (Left)
- Typical CCM puts positive FT O<sub>3</sub> trend, greatest radiative forcing region, in wrong months. BL O<sub>3</sub> trend too low. (Right, update of Stauffer et al., 2019)

## WHAT & HOW: HEGIFTOM Data to the Rescue!

#### HEGIFTOM: IGAC/TOAR II Activity, Co-Leads: R. Van Malderen & H. G. J. Smit

Alternative to still-evolving satellite TrOC (tropospheric ozone column) products:

- Ozone from 5 ground-based instrument types, most from NDACC & related networks: in-service aircraft [IAGOS], ozonesondes, FTIR, Brewer/Dobson Umkehr, Lidar (Photos, Right)
- All instrument types in HEGIFTOM database. Reprocessed data based on rigorous protocols and absolute standards, thus ensuring harmonized time-series with minimal artifacts. Contributing networks
- Each measurement is delivered with <u>uncertainty</u> and a <u>quality flag</u>

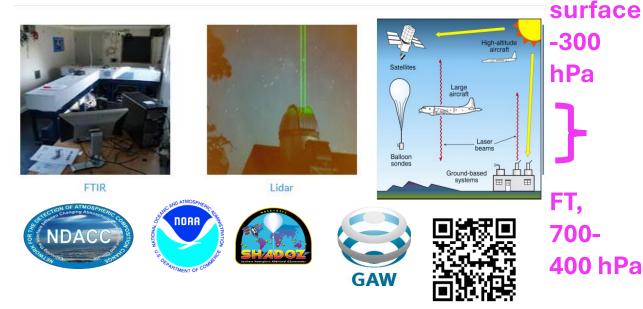

IAGOS

Brewer/Dobson Umkehr

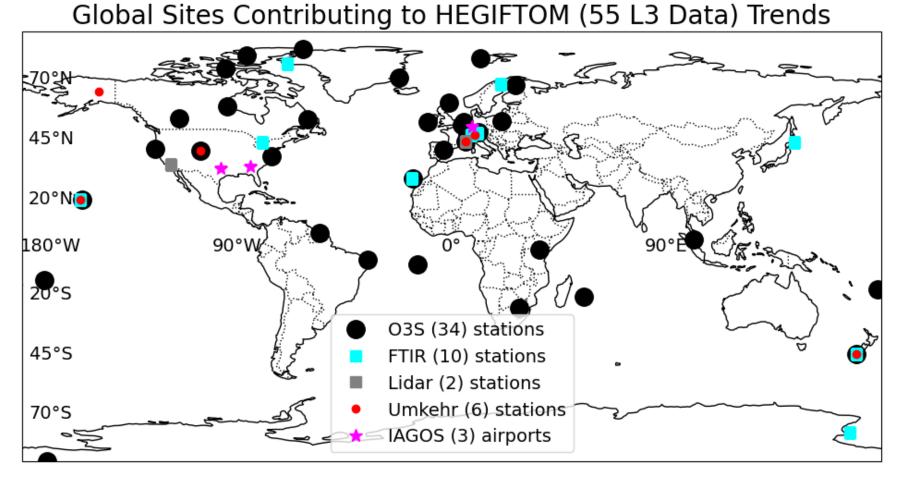

TrOC=

#### **HEGIFTOM Sites/Datasets for 2000-2022 Trends**

**TOAR II Protocol:** Minimum Sample No. to reduce trends uncertainty, start in 2000-2002, end 2020-2022 QR (Quantile Regression) analyses use <u>all data ("L1")</u> from 55 sites; **only 50%-ile results shown**. Monthly means (L3) from 55 sites are analyzed with QR and MLR (multiple linear regression)

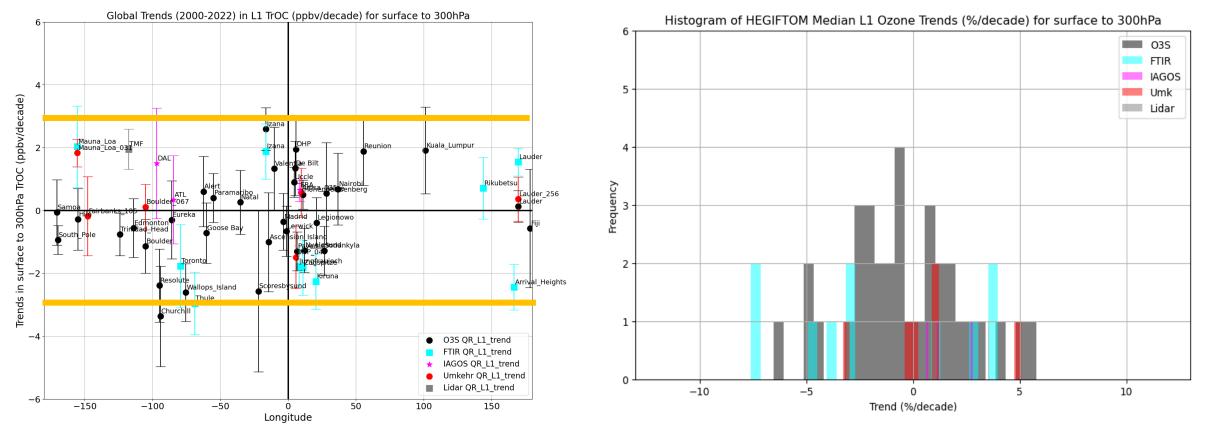

- 1. What do TrOC trends (surface to 300 hPa) for 2000-2022 look like? *Examine "all-site" QR trends & median distribution at 55 sites*
- 2. How do TrOC trends computed with QR and MLR compare? Answer with analysis of L3 (monthly mean) TrOC from 55 stations
- 3. How do TrOC trends from the various instrument types (sondes, IAGOS, FTIR, Dobson Umkehr, Lidar) compare? *Examine trends at colocated stations*
- 4. How do TrOC trends vary by region? *Examine trends on map*

#### **Ques 1.** TrOC QR "All-Site" Trends, 5 Instrument Types

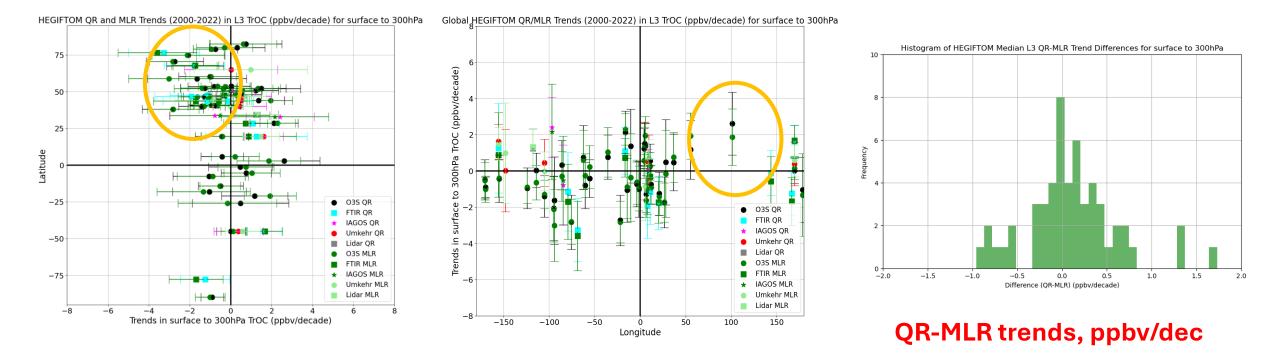

- Left: QR L1 trends for TrOC in TOAR-preferred ppbv/decade (2σ). (1) Median trends nearly all • within +/- 3 ppbv/decade. (2) Medians for most stations ~0. (3) Positive <u>and</u> negative trends appear at all longitudes
- **Right:** Medians in %/decade suggest possible instrument bias. More negatives than positives CEOS-Thompson, 18 Oct 2024

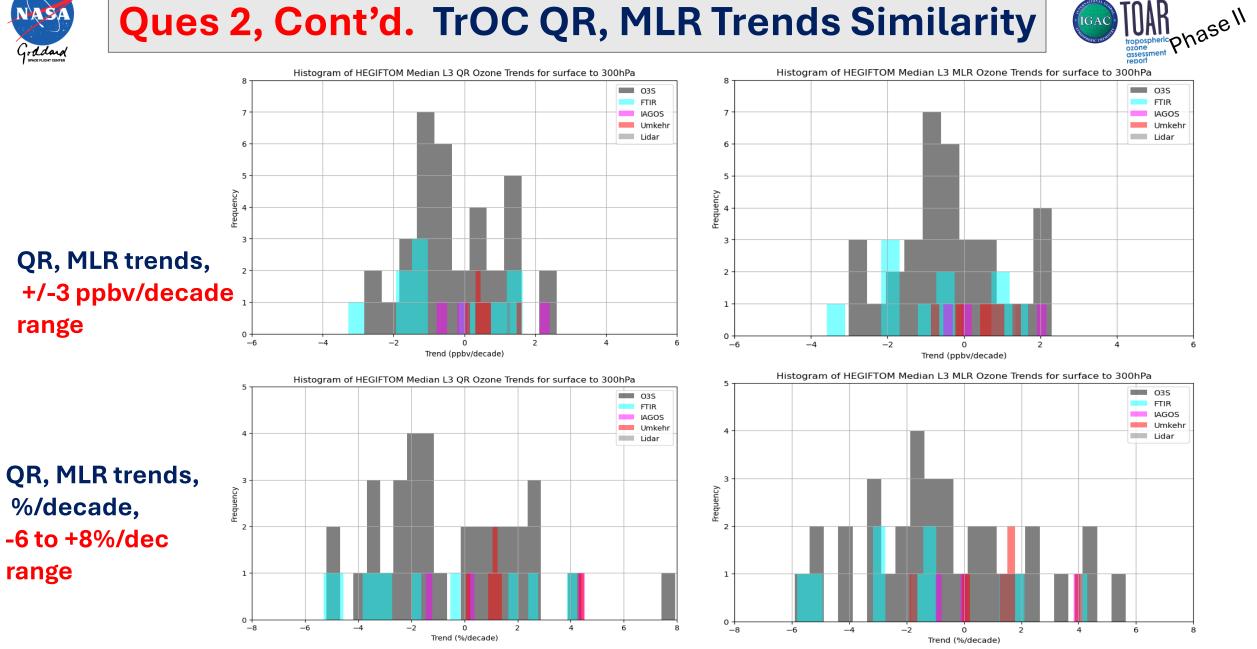

#### Ques 2. TrOC QR, MLR Trends Similar

- Left & Center: TrOC trends, QR= color-coded for 5 instruments. MLR= green shades for 5 instrument types. QR trends tend to be higher than MLR (Right)
- Left: Preponderance of negative trends in No. Hemisphere. Center: few Asian data

CEOS-Thompson, 18 Oct 2024

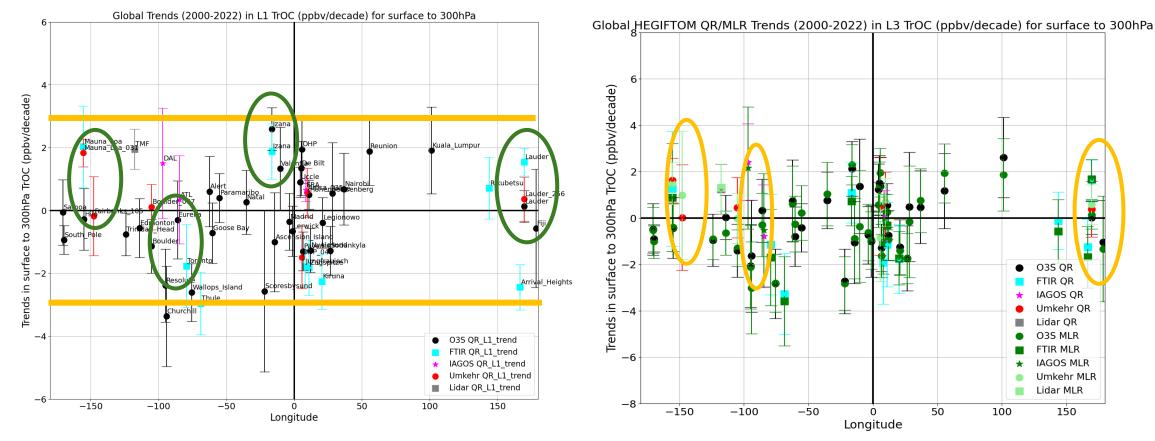

IGAC

troposphe

#### **Ques 3. TrOC Trends from 5 Instruments Compared**

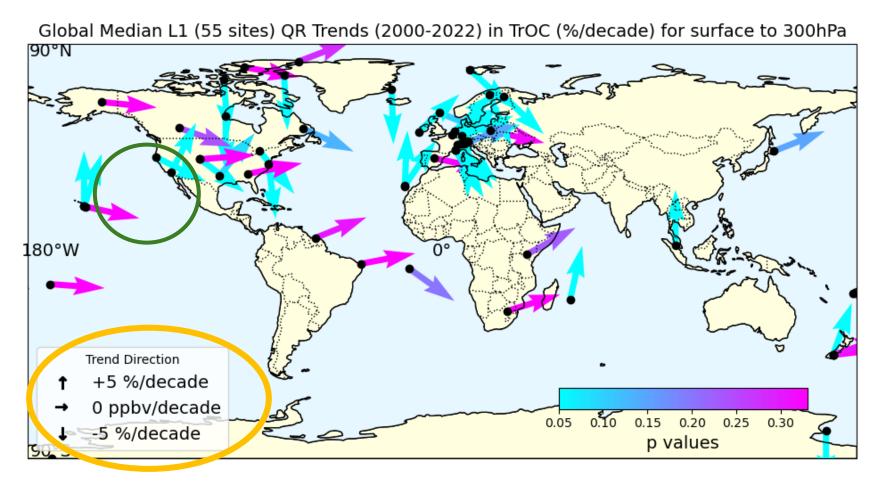

- Left: L1 QR trends, 4 of 6 sites with > 1 instrument show large offsets: MLO/Hilo, Boulder, Izaña, Lauder (Zeng et al., 2024; Björklund et al., 2024)
- Right: Pronounced offsets observed at same sites (MLO/Hilo, Boulder, Lauder) with both statistical methods. Causes unclear – different sampling frequency, protocols, diurnal, seasonal effects investigated

#### Ques 4. TrOC Trends – Global Map View

**Summarizes:** 55 station Trends, moderately positive to negative trends with more confidence (lower p-value) in no. hemisphere (NH). More negative trends in NH. Large divergences at multi-instrument stations. Lack of SH and Asian data in HEGIFTOM limits "global" assessment

#### **SUMMARY**

- TrOC trends (2000-2022) determined from 55 Ground-based Instruments display moderately positive and negative median trends; many with no detectable change!
- Results are independent of QR, MLR statistical method. D. Kollonige SHADOZ talk illustrates outstanding MLR application to equatorial SE Asia trends!

#### **SIGNIFICANCE:** HEGIFTOM data are \*the\* Definitive TOAR Reference. Use them!

- Recommend TOAR Model Comparison project with these values, site by site
- If model (or satellite TOC) disagree, HEGIFTOM can guide improvements

#### **WORK IN PROGRESS:**

- -Understand instrument trend offsets
- -Nearby site trend disagreements- why?
- -Investigate COVID-19 impact on trends
- -"Merge" stations for robust "regional trends" examine 5%-ile, 95%-ile trends

# **HEGIFTOM Trends. Input & Guidelines**

 Recommended TOAR II statistical approach is Quantile Regression (QR) with NOAAprovided test code, e.g., K-L Chang et al., (2023; JGR; 10.1029/2022JD038090)

- Alternative: Multiple-Linear Regression (MLR) as used in Thompson et al., 2021 & Stauffer et al., ACP, 2024. MLR is standard of stratospheric ozone Assessment community
- Above example for a typical SHADOZ station shows merits of each approach. QR gives insights into low-mid-ozone-O<sub>3</sub> profiles. Monthly means from MLR give insight into meteorological or chemical signatures responsible for O<sub>3</sub> trends

#### **Tropospheric ozone column: COVID impact**

O ozonesondes  $\triangle$  Umkehr  $\Box$  IAGOS  $\nabla$  Lidar

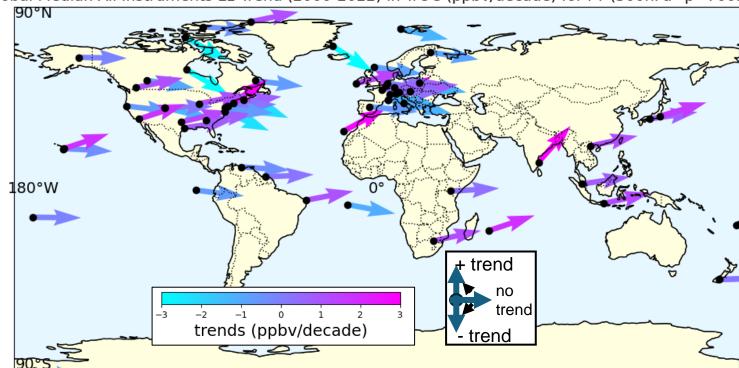

- Relative change of mean TrOC for the time period 2000-2022 vs. 2000-2019 Blue: 2000-2022 < 2000-2019 Red: 2000-2022 > 2000-2019
- Decline in 75% of the sites, on average -0.3% prominent in NH (spring + summer), stronger in FT.
- From R. Van Malderen, RMI
- Impact on trends!

HEGIFTOM Paper 1 Figs, UPDATE-17oCT

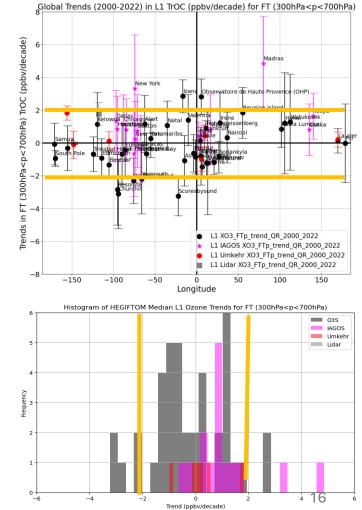

- Left: Sites (sondes, IAGOS, Umkehr, lidar), 50-%ile median profiles, L1 analyzed with QR, 2000-2022. Upper Right: FT OC, 700-300 hPa, mostly smaller than TrOC trends; several exceptions in tropics.
- Changes mostly < 2.0 ppbv/dec, positive OR negative

Global Median All Instruments L1 Trend (2000-2022) in TrOC (ppbv/decade) for FT (300hPa<p<700hPa)

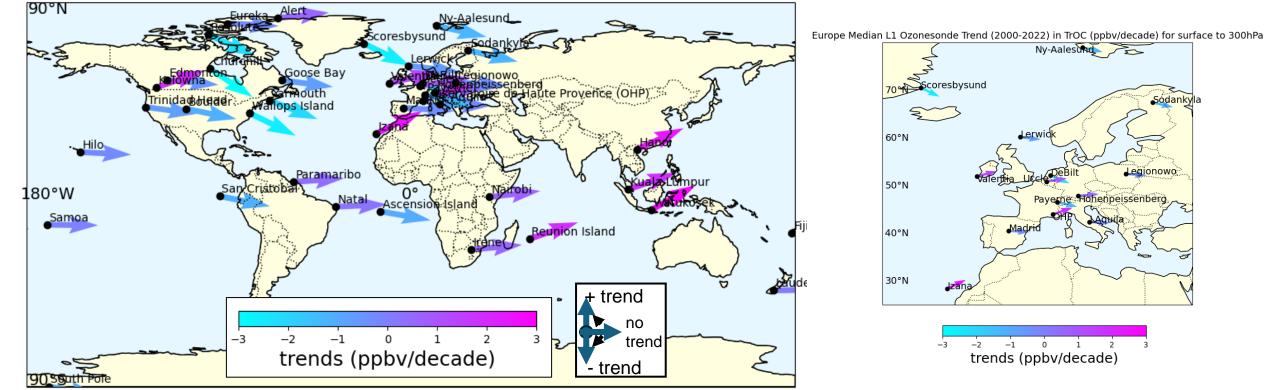

#### **Ques 2.** Ozonesonde TrOC Regional Trends

- Sonde (black points), **50-%ile median** profiles, L1 data analyzed with QR, 2000-2022
- Left: TrOC (surf-300 hPa) column, negative-> zero trends, blue shades

Global Median L1 Ozonesonde Trend (2000-2022) in TrOC (ppbv/decade) for surface to 300hPa

 Trends <3 ppbv/dec, positive or negative, <u>all lat, long (2 outliers)</u>. Right: Western Europe sonde trend zoom

#### **HEGIFTOM Sites/Datasets for 2000-2022 Trends**

- Global Observation Sites Contributing to HEGIFTOM (L1 Data) Trends 45°N 20°N() 180°W 20°S O3S (41) stations 45°S Õ FTIR (15) stations Lidar (1) station Umkehr (6) stations 70°S IAGOS (15) airports
- **TOAR II Protocol:** Require Minimum Sample No. to reduce trends uncertainty. L1 QR analyses use all data from 78 sites; only 50%-ile results shown. Monthly means (L3) are subject to more gaps so fewer sites (68, 62) are analyzed
  - CEOS-Thompson, 18 Oct 2024

- S L1 QR Data Trends (78):
  - O3Sonde (41)
  - FTIR (15)
  - IAGOS (15)
  - Umkehr (6)
  - Lidar (1)

#### L3 QR Data Trends (68):

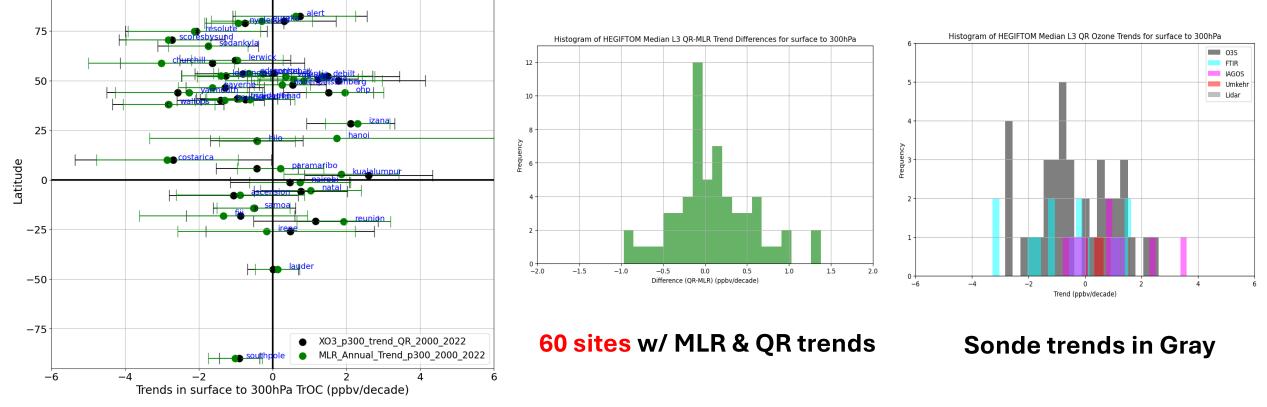

- O3Sonde (37): excludes Hanoi, San Cristobal, LaQuila, Watukosek
- FTIR (14): excludes Boulder
- IAGOS (10)
- Umkehr (6)
- Lidar (1)
- L3 MLR Data Trends (62):
  - O3Sonde (38): excludes San Cristobal, LaQuila, Watukosek
  - FTIR (14): excludes NyAlesund
  - IAGOS (3)
  - Umkehr (6)
    - Lidar (1) 18

#### **Ques 1. MLR & QR TrOC TRENDS SIMILAR**

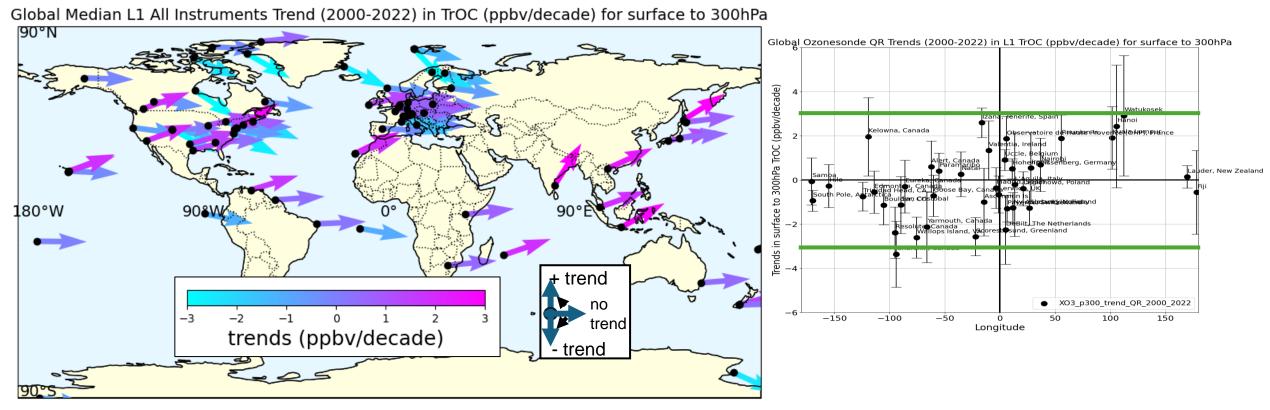

- Left: Sonde trends for trop. column (surface-300 hPa, ppbv/dec) with L3 data mostly overlap within uncertainty (black=QR, green=MLR). Center: Small bias toward larger MLR trend
- **Right:** Positive: negative trends ~50:50. Given uncertainty, ~50% of sites show no trend!

### **Ques 2. B. All-Site TrOC Regional Trends**

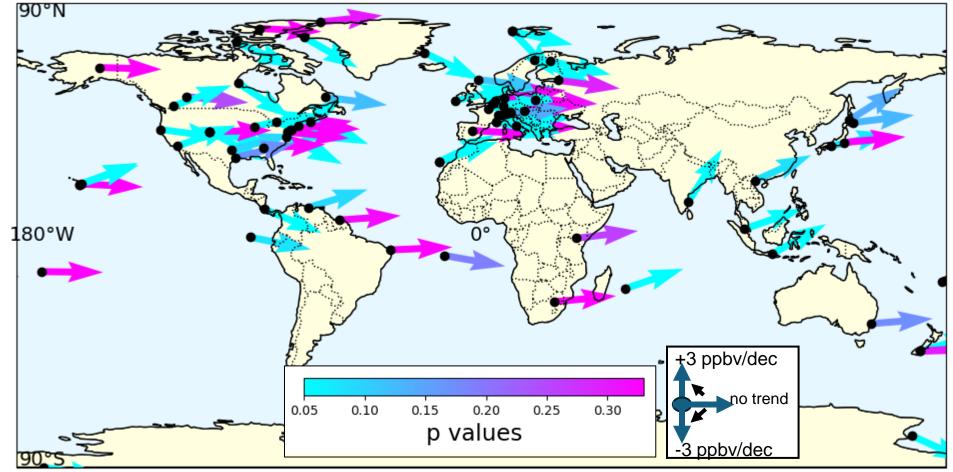

- Sonde (black points), **50-%ile median** profiles, L1 data analyzed with QR, 2000-2022
- Left: TrOC (surf-300 hPa) column, with multi-instrument data for several sites. Note divergent trends at Hilo/MLO: Umkehr sees FT pollution increase, sonde TrOC declines
- Right: Trends < 3 ppbv/dec, positive or negative, all lat, long (only 2 sonde outliers)

# Ques 1. QR TrOC Trends: All instruments w/ p-values Surface to 300hPa - All Sites within +/- 3 (ppbv/decade)

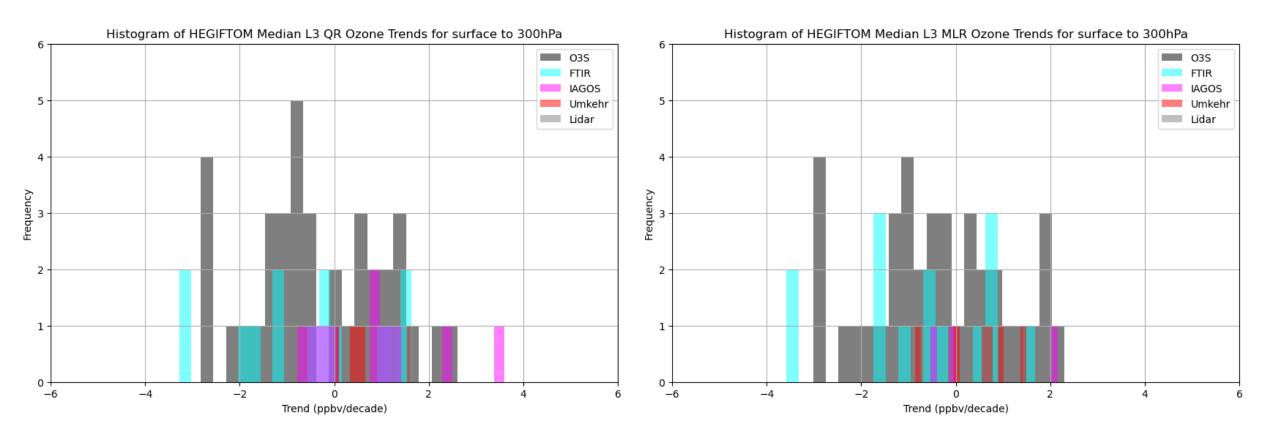

Global Median L1 Trend (2000-2022) in TrOC (ppbv/decade) for surface to 300hPa

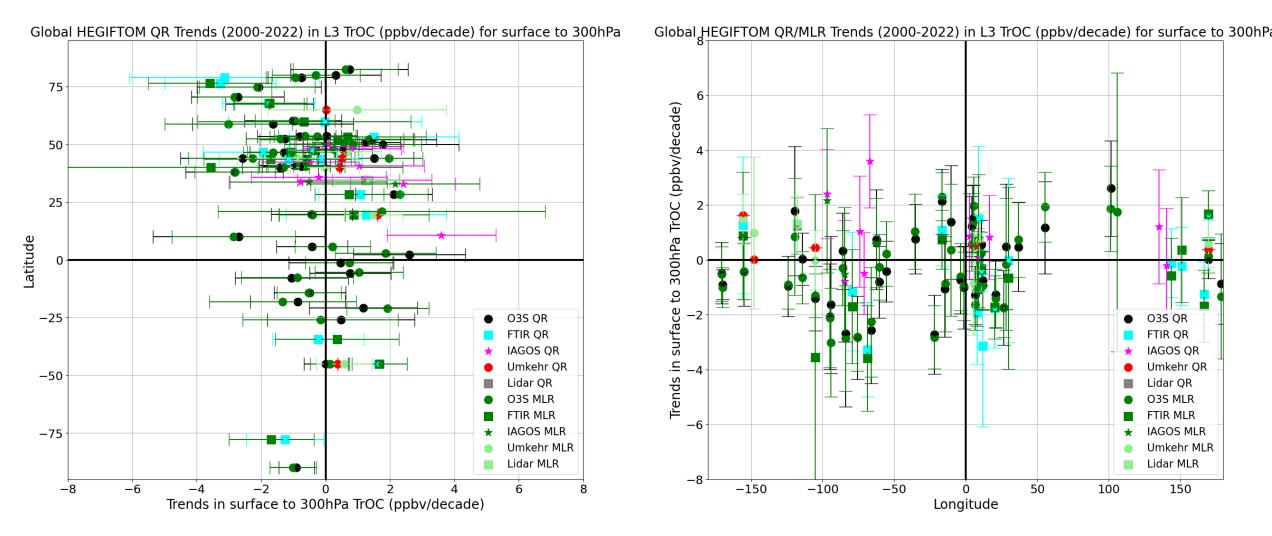

# **Right** MLR L3 Trends for all datasets , surface to 300hPa

For L3 there are slightly fewer stations than for L1

tropospheric Phase II assessment report

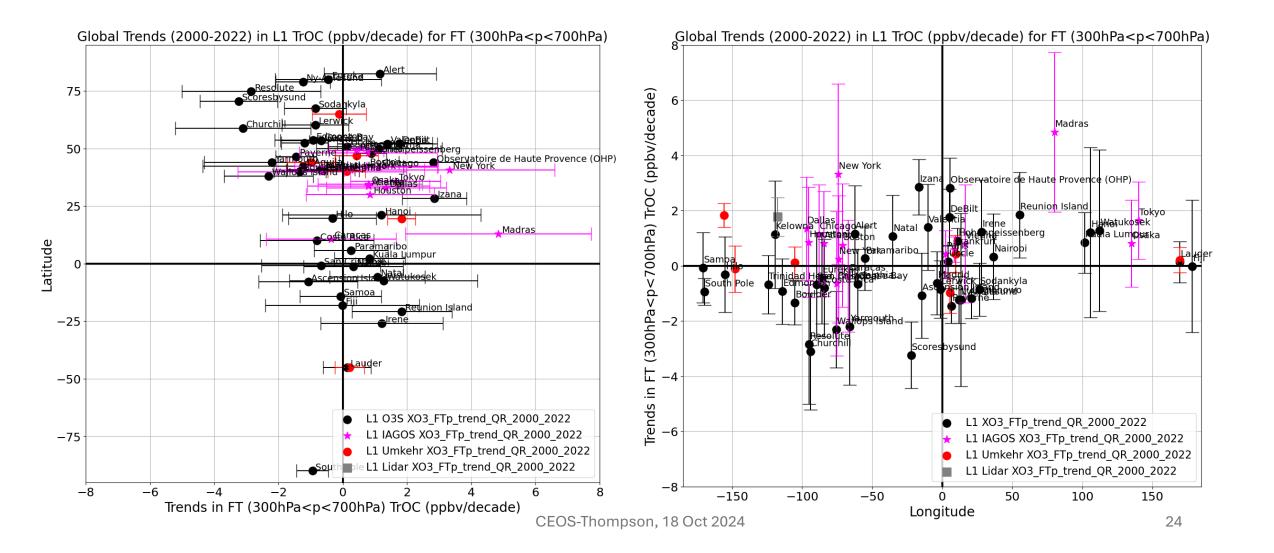

#### **Ques 4- 22/April** HEGIFTOM QR and MLR L3 Trends-All TrOC Data: Surface to 300hPa Most stations within +/- 3 (ppbv/decade)

CEOS-Thompson, 18 Oct 2024

# **FT – data from 3 inst** QR L1 Trends for all , for ~60 sites **FT** (300<p<700hPa). Most stations within +/- 2 (ppbv/decade)

# QR Trends for Ozonesondes/IAGOS/lidar, ie same as Fig 3 except for LT (0-4km). Most stations within +/- 3 (ppbv/decade). *This is for L3 and needs to be updated to L1*.
