

TROPOMI

S5P/TROPOMI Level 2 File Format and Units

Pepijn Veefkind with input from:
Maarten Sneep, Mattia Pedergnana, Mark ter Linden,
Walter Zimmer, Arnoud Apituley

File Format

1. Select a file format that users are already familiar with
2. Use a base format that is already well supported in data-analysis packages
3. Use a self-describing file format
4. Build on experience with supporting previous missions

Basic choices

1. NetCDF-4 (build on top of HDF5)
2. Climate & Forecast Metadata Conventions
3. One product per file
4. Store metadata in separate group structure for Inspire/ISO, ESA, OGC, EOP metadata
5. Add our own wishes & constraints
 - Group structure, names of variables, ...

Formal requirements

- Metadata
 - ESA metadata from file format standard
 - ISO 19115 metadata (Inspire directive)
 - OGC metadata
- Climate & Forecast metadata conventions

CF-Conventions

- Used by climate modellers and weather forecasters, additional users are coming from earth observation and other climate researchers.
- Declared applicable to ESA's Climate Change Initiative/Essential Climate Variables projects.
- Maintained by volunteers, KNMI contributes to CF-2.0

Variable level metadata

- From CF Metadata Conventions
 - Standard name
 - Units
 - Comment
 - Long name

Advantages of CF

- Standard names describe exactly what quantity is contained in a variable
- Units define how the quantity is expressed
- Other attributes link to ancillary data (location, time, precision, flagging, averaging kernel, ...)
- The combination of all aspects means that correct use of the data is promoted

SI-Units

- Follow IUPAC recommendation we adapt SI units.
- The NetCDF Users' Guide specifies that variables should have a ‘units’ attribute
- CF-standard names list gives a “canonical unit”, for example: mol/m²
- Use UDUnits for conversion

Units: Examples

- 300 DU -> 0.134 mol/m^2
- $2.0\text{e+15 molecules/cm}^2$ -> $33 \mu\text{mol/m}^2$

Conclusions

- S5P/TROPOMI L1B and L2 formats are based on NetCDF 4 with CF metadata.
 - File format documents are available on request
- For the units the SI units are adapted.

IUPAC

- Units for use in atmospheric chemistry
(IUPAC Recommendations 1995)
 - [http://www.iupac.org/publications/pac/
67/8/1377/](http://www.iupac.org/publications/pac/67/8/1377/)
 - Pure Appl. Chem., 1995, Vol. 67, No. 8-9, pp.
1377-1406. DOI:10.1351/pac199567081377

Units

- L1B uses “ $\text{mol} \cdot \text{s}^{-1} \cdot \text{m}^{-2} \cdot \text{nm}^{-1} \cdot \text{sr}^{-1}$ ” for radiance, normalised to 1 A.U.
