LSI-VC-13: QUICK RECAP..

CONTROL & Confidence
in Algorithms

- RS-2/2A SR generation is fully automated
- RS2 is harmonized with reference to RS2A
- Radiometric Accuracy is around 95 % - Validated with In-situ & OLI over Indian terrain
- Geometric accuracy is better than 1 pixel
- SR Products can be ordered from Bhoonidhi.
- ARD sets are generated over 3 sample areas from 2017 to 2022
- Requested LASRC-generated AOD datasets over Indian region-**Received 10no.s**
- SR Products over Global terrains would be provided for the endorsement

R2A-L3 : LASRC(AOD)- SR VS ACT-RS(AOD): SR

Vegetation Profile

X-axis: LASRC-SR Y-axis: ACT-RS

LASRC(AOD) & ACT-RS(AOD) Values are in good agreement over non-cloudy regions

OBJECTIVE -1 : ABSOLUTE VALIDATION WITH RADCALNET

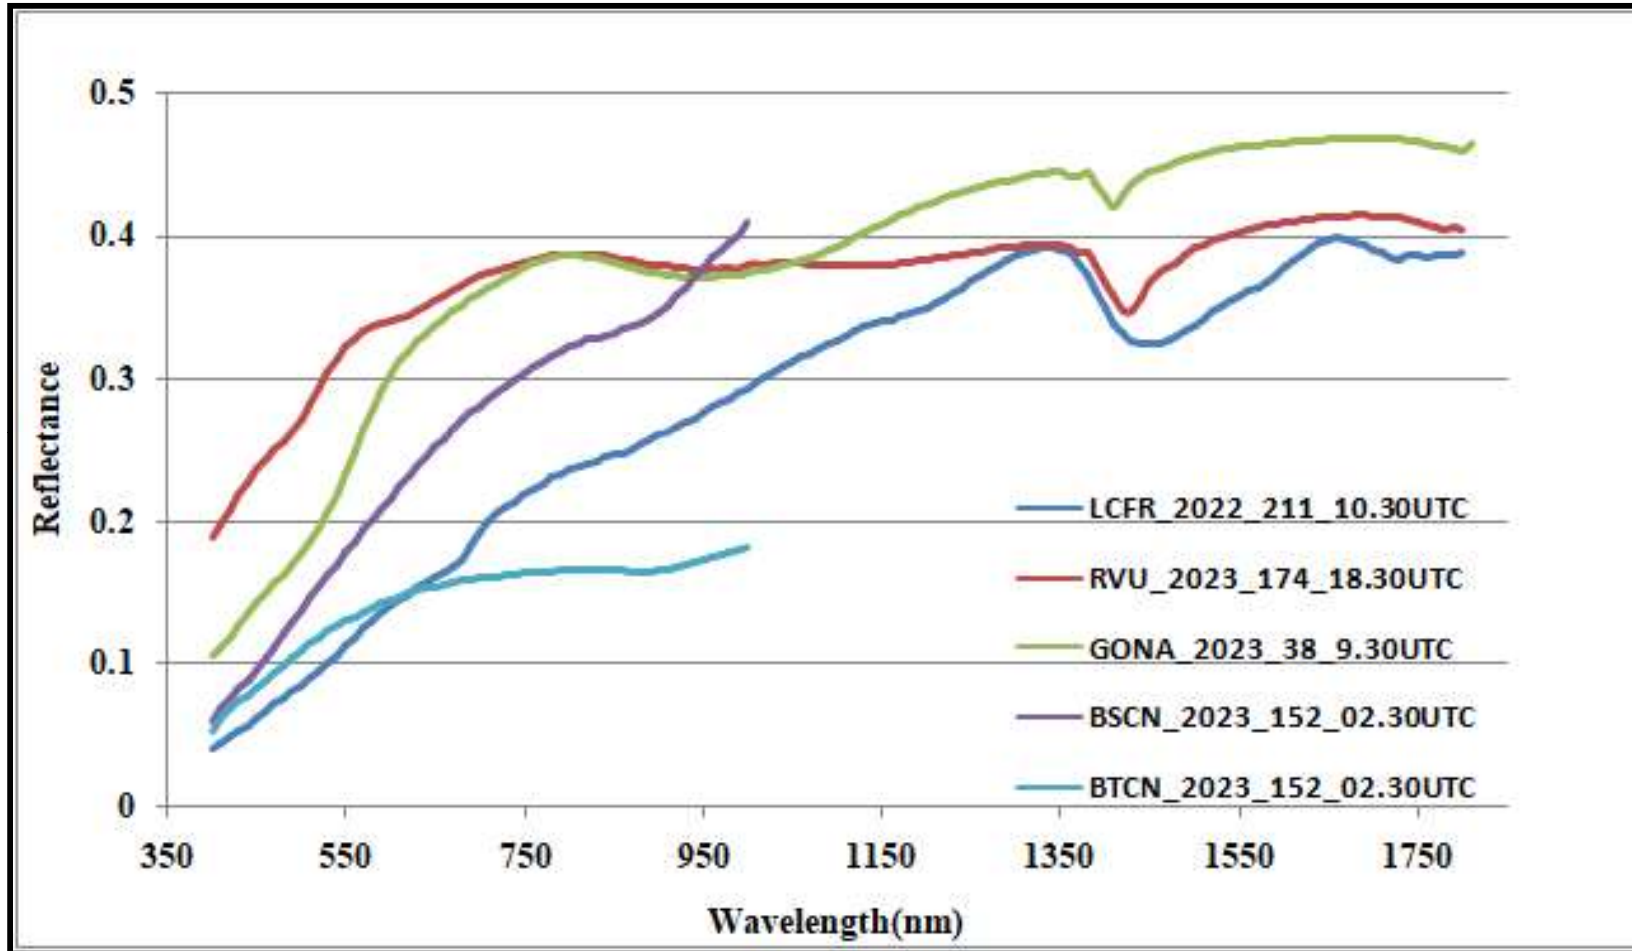

1. SR products from RS-2/2A L3 and AWiFS sensors over the sites since launch (2013 & 2017) are generated using 6S-RT code by using auxiliary information provided with Meta file and ancillary data sets from CAMS.
2. The Radcalnet provides the corrected reflectance values over four instrumented reference test sites namely Railroad Playa(USA), Baotou(China), La Crau (France) and Gobabeb(Namibia) at 30 minute intervals from 9am to 3pm.
3. Each site is equipped with automated ground-based radiometers and spectrometers that are used to measure surface and atmospheric parameters for the simulation of TOA reflectance.
4. The spectral range is 400-2500nm sampled at 10nm.
5. These sites can be used for validation of medium resolution sensors like L8/L9, Sentinel-2 MSI and L3.
6. Ground reflectance (BOA) from Radcalnet site is converted to R2/2A sensor's reflectance using spectral response function of the sensor's band as

$$\rho(\lambda)_i = \frac{\int_{\lambda_1}^{\lambda_2} \rho(\lambda) S_i(\lambda) d\lambda}{\int_{\lambda_1}^{\lambda_2} S_i(\lambda) d\lambda}$$

Where $S_i(\lambda)$ is the sensors spectral response function and $\rho(\lambda)$ is spectral reflectance value.

7. Data measured at satellite overpass local time is considered for the comparison.

CORRELATION & SSIM

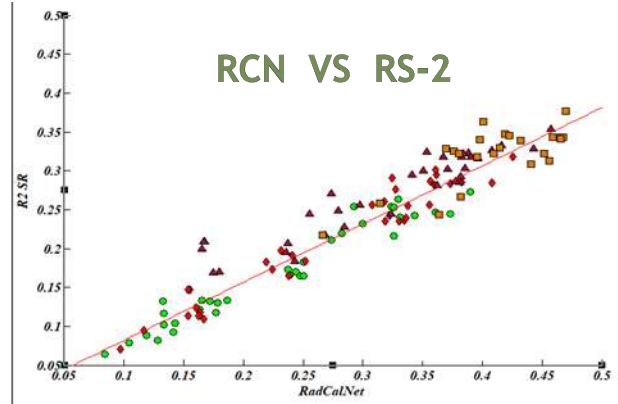

OBJECTIVE -2 : RELATIVE VALIDATION WITH OLI OVER RCN & CEOS SITES

1. L8/9 OLI SR products were aggregated using nearest neighbour interpolation techniques to match the resolution of L3 and AWIFS.
2. ROIs (2 to 4km area) are extracted from near synchronous L8/9 and L3 datasets on the site location.
3. Band wise Standard least squares linear regression was then used to represent the differences in surface reflectance between OLI and RS-2/2A pixels.
4. Parameters such as MAD, RMSE, SMAPE,SSME were computed to quantify the agreement

LSI-VC-14: Summary..

Confidence in accuracies

- SR Product accuracy is around 95% with ground measurements & OLI
- Accuracy is consistent since launch
- ARD Products are ready for endorsement

Thank you..
धन्यवाद..
