Report on the GEO-GSNL initiative

Stefano Salvi
Chair of the GSNL Scientific Advisory Committee

CEOS WG Disasters meeting #15
The Supersite network in March 2021

- Hawaiian volcanoes
- San Andreas Fault
- Icelandic volcanoes
- Mt. Etna volcano
- Campi Flegrei & Vesuvius volcano
- Marmara faults
- Chinese faults
- Kamchatka volcanoes
- Southern Andes volcanoes
- Nicaraguan volcanoes
- Corinth Gulf faults
- Virunga volcanoes
- Taupo volcanic zone

(proposed ones in blue)

Supersite reports

Submitted on December 9:

- Hawaii Supersite
- Enceladus (Greek) Supersite
Hawaii Supersite report

Highlights:

• Following the 2018 Kilauea eruption and caldera collapse, there has been an increased interest in the CEOS Supersite data, with several published papers using SAR and optical data for topographic changes, deformation, geomorphological analyses, volcano-tectonic analyses, etc.
• Very good use of the data to support local users

It documents a number of processes acting since the end of the 2018 eruption, including:

• re-inflation of the East Rift Zone,
• re-inflation of the summit,
• subsidence of the Southwest Rift Zone.
Enceladus Supersite report

• Following the recent seismicity in the western area (Ionian islands), a number of studies have been carried out.
• A few projects have been started in the Supersite area.
• CEOS data quotas have not been used in the last two years. Only Sentinel 1 SAR data are used for ground deformation.

Dilatation across the Corinth Gulf calculated from GPS-derived strain rates (DSO-NTUA)
Supersite proposals

• The Nicaragua volcano Supersite
  (revised version submitted for approval)
Title: Volcano-tectonic Geohazard Interaction within the Nicaraguan Depression

Coordinator:
Iris Valeria Cruz Martínez
Director General of Geology and Geophysics, Nicaraguan Institute of Territorial Studies – INETER

International partners:
Pensilvania University
Observatoire du Physique du Globe
Universität Heidelberg
Universidad Nacional Autónoma de México
Nicaragua Supersite proposal objectives

- access satellite EO data to complement the ground networks;
- learn how to use them for volcano monitoring and surveillance;
- improve knowledge of key geological processes and assess volcanic hazard;
- establish wider international scientific collaboration;
- progress on ground data sharing on a global scale.
Nicaragua Supersite proposal revised

For the SAC reviews:
• The proposal now explains better how the use of the research results will support the National Disaster Prevention framework (Sistema Nacional para la Prevención, Mitigación y Atención de Desastres);
• The Open access to ground data has been more clearly stated, to facilitate data access the proposers will negotiate a data policy with GSNL.

For the Agency reviews:
• DLR - TanDEM X data request has been canceled; a clear data request is now made, with clear objectives;
• ASI – the objectives and priorities have been clearly stated.
### Nicaragua Supersite EO data requests

<table>
<thead>
<tr>
<th>EO data</th>
<th>Usage</th>

Decisions for GSNL at WGD meeting #15

1. Decision on acceptance of Nicaragua Supersite
2. Decisions on renewed support to Hawaii and Enceladus Supersites
