A USER-DRIVEN GEOSS

10 Year Implementation Plan for the Global Earth Observing System of Systems (GEOSS) endorsed by Ministerial Summit in 2005:

- build GEOSS as a user-driven system of systems;
- develop a User Requirement Registry;
- frequently review the user needs as a basis for gap analysis.

Designing, building, populating and using the URR started in 2006

The experience over the last years made clear:

Collecting information on user needs and translating them into observational requirements is not a straight-forward task.

We learned:

The process and infrastructure for collecting user needs and observational requirements need to:

- reach out to, and engage, global users across all societal areas;
- enable users to express their needs;
- be flexible, adaptable, proactive, versatile, comprehensive;
- allow for frequent (gap) analysis.

PURPOSE AND BENEFITS OF THE URR

Purpose: Collect, publish, store, and analyse information on user needs

Analyze user needs:

- Determine societal relevance of user needs and observation requirements in support of prioritization
- Identify gaps in the observation system or application network
- Measure the societal relevance of datasets and products

Benefits:

- Cross-cutting through all SBAs and multidisciplinary nature
- Addresses a void, because most requirements registries are Provider-focused
- Interactive nature of URR allows users to publish data, and provide comments on other data entries (Wikipedia-like system)
- Provides a place to store and integrated the results of many specialized assessments and registries

The GEOSS User Requirement Registry (URR)
The intergovernmental Group on Earth Observations (GEO) is building the Global Earth Observation System of Systems (GEOS) to help users better utilize earth observations in a broad range of societal benefit areas including health, agriculture, water, energy, weather, climate, disasters, ecosystems, and biodiversity. GEOSS is user-driven. The User Requirements Registry (URR) is a versatile component of the GEOSS Common Infrastructure (GCI) for the collection and quantification of user-related information and a crowd-sourcing tool for the engagement of users with GEOSS. [Read More ...](#)

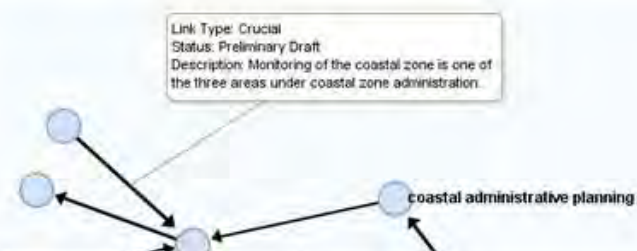

The Role of the URR for the GEO Work Plan Implementation
The URR also provides important functions supporting the implementation of the GEO Work Plan. [Read More ...](#)

The URR Data Model
The core of the URR is a comprehensive database with information about:

- Applications
- Earth Observation Requirements
- Research, Technology, Infrastructure, and Capacity Building Needs
- Interconnectivity (links) between all entries. [Read More ...](#)

Analyses of User Needs
The URR is designed to facilitate three generic types of analyses:
Prioritization of user needs and observational requirements, Gap analyses, and Relevance analyses

Key for all three analyses is information about the interconnectivity between specific entries in the URR, which is captured in the Links function and graphically displayed using a visualization tool. [Read More ...](#)

GEOSS: A System of Systems Driven by Societal Benefits

The Group on Earth Observations (GEO) is building the Global Earth Observation System of Systems (GEOSS) to address a wide range of Societal Benefit Areas (SBAs) of Earth observations (EOs) (GEO, 2005). Utilizing the Societal Benefits approach requires an interdisciplinary scientific approach; a scientific interpretation of the collected observations are, or could be, utilizing EOs provides important guidance to the development and use of GEOSS. Knowledge can provide a basis for an objective measure of societal relevance of observations and applications.

GEOSS Infrastructure interactions VERSION GCI2-4B

(URR) is an integral part of the GEOSS Common Infrastructure (GCI) that allows answering questions related to an user-driven design and functionality of GEOSS. The URR collects user-related information, such as user types, their applications and activities, the requirements of the applications in terms of EOs and other products, and the needs in terms of research, infrastructure, technology, and capacity building that would enable or improve applications. This information is collected in standard formats and nomenclature across disciplines and SBAs. Interconnectivity of the entries in the URR is captured with a novel link concept, and this information enables the prioritization of applications, requirements and needs, gap analyses, and the determination of the relevance of a given data product.

The URR is inherently linked to other components of the GCI,

GEOSS User Requirements Registry: Tutorials

Welcome to the tutorials for the GEOSS User Requirements Registry (URR). The URR is a utility that allows the viewing, publishing, and analyzing of user needs in terms of Earth observations and related information. The Tutorials provide a guided tour that walk you through the menus of the URR. Main emphasis is on the publishing of new information.

The forms of the URR allow the publishing of information on Applications, Requirements, Research Needs, Technology Needs, Infrastructure Needs, and Capacity Needs as they relate to decision making and Earth observations. Each entry collects the terms used to describe these entities, and references with more detailed information of each of the entries in the forms can be provided. Information from the various forms are interconnected is captured in a Link form, where each entry describes the linkage between any pair of entries in the other forms. For more information on the forms mentioned here, see the [glossary](#).

In the View menu, you can view individual entries in any of the forms. You can also view reports with several entries, and you can export the result of a search for processing with other programs. The Publish menu provides the forms that allow you to publish new entries, and to edit existing ones. The Analyze menu will provide the function to construct and analysis the networks, which connect Earth observations to end users. The Preferences menu allows you to customize the URR to your personal needs and preferences. The Login menu allows you to register as a user of the URR and to login, which then comes with a number of added functions and conveniences not available to anonymous users.

The following tutorials are currently available:

- **General:** General properties of the URR
- **View:** Searching the URR, viewing entries, and exporting them.
- **Publish:** Publishing new, and editing existing, entries.
- **Analyses:** Analyzing the URR contents.
- **Preferences:** Specifying preferences and developing personal portfolios.
- **Login:** Registering as a user of the URR and utilizing the benefits of a registered user.
- **Prepare Input:** Comments on preparing input for the URR and examples.

Note that a [brief introduction](#) to the URR is also available in the [Tutorials](#).

General: General properties of the URR

View: Searching the URR, viewing entries, and exporting them.

Publish: Publishing new, and editing existing, entries.

Analyses: Analyzing the URR contents.

Preferences: Specifying preferences and developing personal portfolios.

Login: Registering as a user of the URR and utilizing the benefits of a registered user.

Prepare Input: Comments on preparing input for the URR and examples.

LOOK AND FEEL OF THE URR

The screenshot shows the GEOSS URR website interface. A blue oval highlights the navigation menu with the following items: Home, View, Publish, Analyze, Preferences, and Log In. A callout box points to this menu with the following text:

- View
- Publish
- Analyze
- Preferences
- Log in

The website header includes the GEOSS URR logo and the text "USER REQUIREMENTS REGISTRY". The top right corner features the "GROUP ON EARTH OBSERVATIONS" logo and links for "Feedback | Tutorials | GEOPortal".

Publish

Welcome to the publication section of the URR.

The URR provides in-line help functions with each option, indicated by a question mark symbol. Clicking on this symbol will provide help on the type of information and, if applicable, the required information.

The URR aims to provide information on the type of information used should be used to be supported by the URR. The URR aims to be used to be supported by the URR.

User requested to add four relations:

Research Needs: What we need to understand and better

Technology Needs: What we need to develop to ...

Infrastructure Needs: What we need to build ...

Capacity Needs: What we need to learn and enable ...

Lexicon:
Terms &
Controlled vocabularies

References:
Bibliography

Links:
Interconnectivity

Originally, we started with three basic relations:

Applications: What we do (with and without Earth observations)...

User Types: Who does it or benefits from it ...

Requirements: What we need to do it ...

URR DATA MODEL

Seven key relations:

Applications

User Types

Requirements

Research Needs

Technology Needs

Infrastructure Needs

Capacity Building Needs

Auxiliary Registries:

References

Lexicon

URR DATA MODEL

Lexicon:

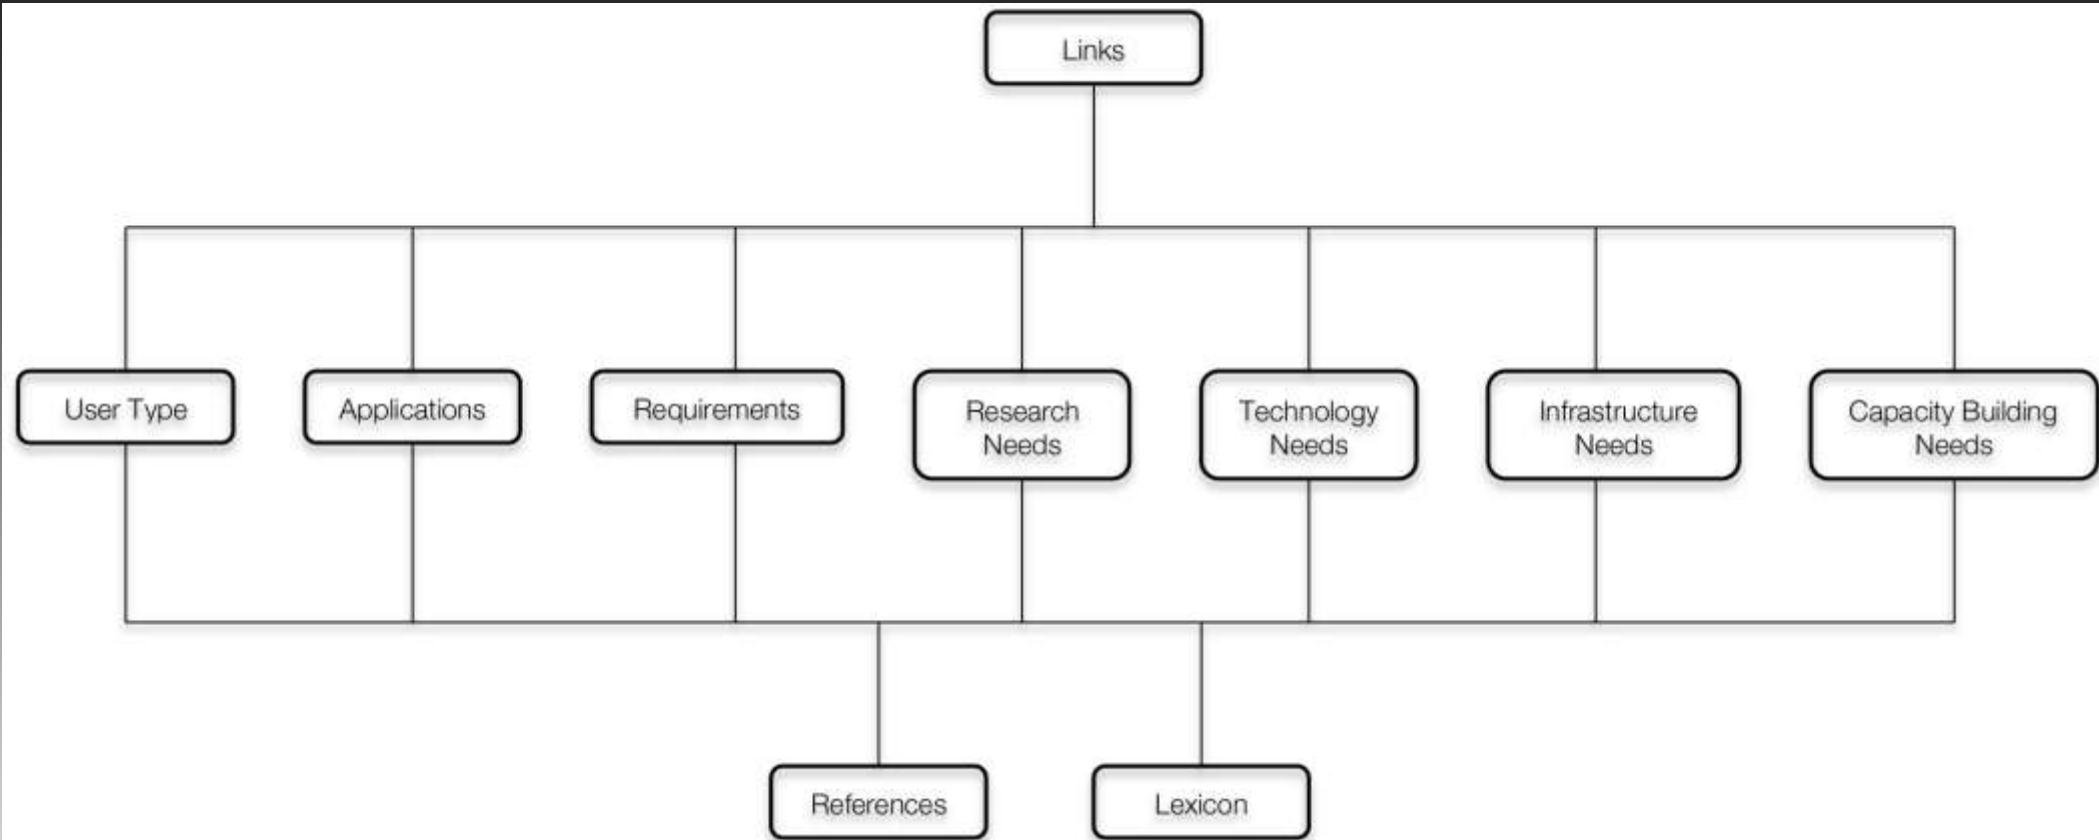

- collects all terms used in the URR;
- contains the controlled vocabularies

Controlled Vocabularies include:

- definition of acronyms and abbreviations;
- keywords;
- Earth observation parameters;
- units of observation parameters or other quantities;
- media;
- attributes of observations;
- geographical areas;
- Essential variables.

Lexicon and Controlled Vocabularies may be integrated into a GEOSS-wide Semantic Registry

URR DATA MODEL

Interconnectivity:

Links

URR DATA MODEL

How can we capture interconnectivity in value-chains from Earth observations to societal benefits?

Links: connect a source entry and target entry in the same or in two different of the seven key relations.

Link concept turned out to be very powerful to capture connectivity between different elements.

Allows the construction of value chains and networks of value chains from Earth observations to end users.

POPULATING THE URR

Four approaches used so far:

- (1) Expert input (e.g., US-09-01a Assessment Reports, Communities of Practice)
- (2) Crowd-sourcing (open peer contributions)
- (3) Harvesting existing registries
- (4) Interviews (selected user groups)

Issues:

- Understanding Applications, User Types, Requirements, Links, ...
- Large differences in the quality and granularity of entries
- Spam
- URR data model differs from most published documents and existing data bases

There is a need for reviewing and editing of entries.

Name: GST4 transition of infrastructure from research to sustained
 Status: Final Draft
 Description: Observational infrastructure developed for research projects, which has value for long-term monitoring should be transitioned to sustained operation.

Problem Description: Infrastructure developed for research projects often turns out to have a long-term operational value. The GEOSS Strategic Target 4 requests that the transition be encouraged where needed.
 Expected Impacts: Preservation of valuable infrastructure and augmentation of the sustained GEOSS.

ANALYSES

Analysis goals:

- Prioritization: importance of requirements, applications, user types, ...
- Gap analysis: which requirements are (not) met?
- Relevance: How relevant is this data set?

Prioritization - URR internal:

- What user types and applications depend on this requirement?
- What data products are needed for this application?
- What research is needed to enable this application?

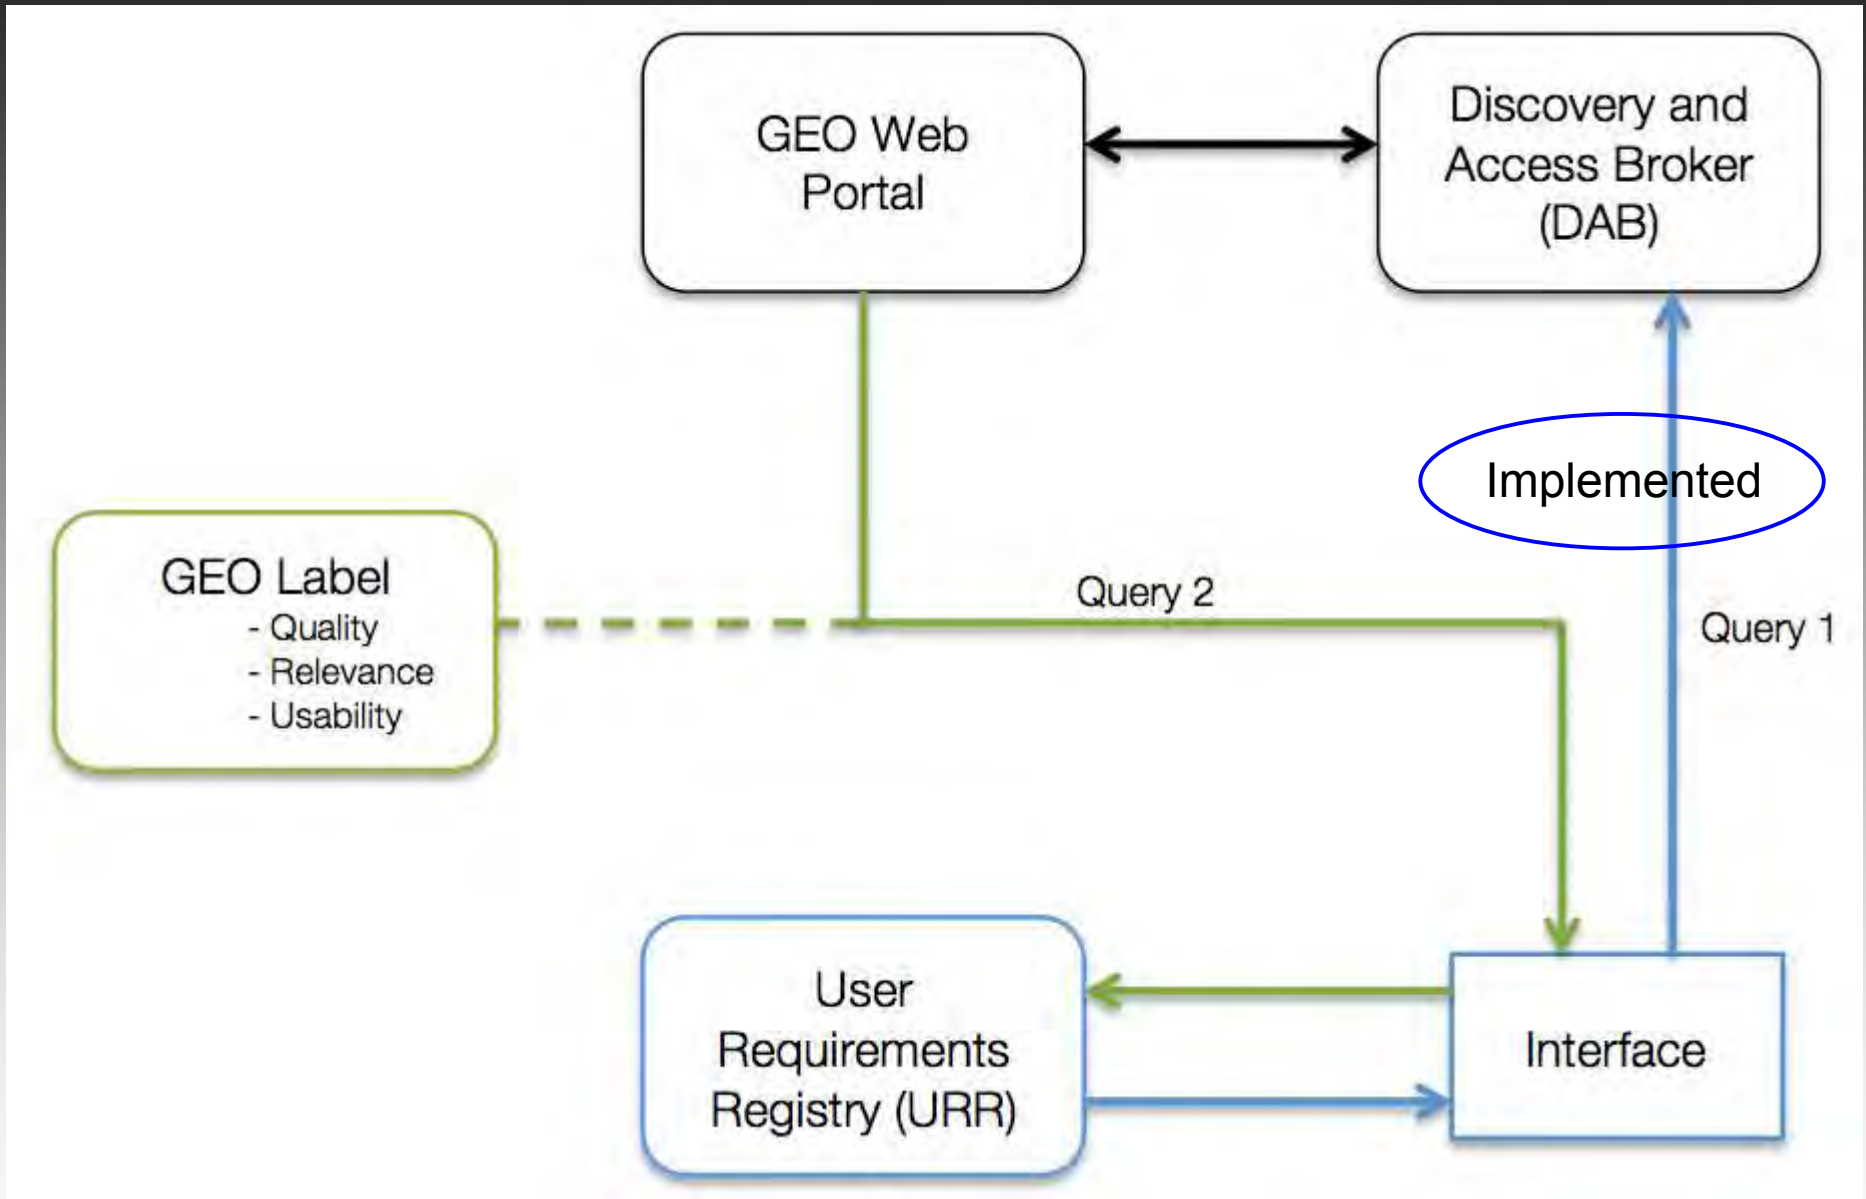

Gap Analysis - URR to Discovery and Access Broker:

- Are there data products that would meet my needs?

Relevance Analysis – GEO Portal to URR:

- Who is using my data for what?

ANALYSES

Prioritization: based on relevance within URR

Gap analysis: Query 1

Relevance of datasets or products: Query 2

SUMMARY & OUTLOOK

Main points:

- URR links Societal Benefits, Science Disciplines, and GEOSS
- Populating the URR requires a multi-faceted approach
- Users need guidance in analyzing and publishing their needs

Users request new functionalities:

- Research needs, infrastructure needs, technology needs and capacity building needs were user requests
- linking of datasets to requirements
- linking of standards and best practices to applications
- linking of individual users to user types
- associated social network

OUTLOOK: MORE CONNECTIONS AND INTEROPERABILITY
