

CEOS WGISS / GEOSS Reference Model for the Use of Satellite Data in Disaster Response and Risk Assessment

John Evans - GST, Inc.

Karen Moe - NASA Earth Science Technology Office

WGISS-34 Briefing & Discussion

Hyderabad, Sept. 2012

Problem statement

- Int'l disaster management involves:
 - Many activities by many players
 - Many ad hoc arrangements
 - => Limited effectiveness, efficiency
- Unclear how new suppliers can plug in their data / services
- Unclear how new users can tap into these data / services
- Unclear what resources are shared ... missing ... interdependent ... isolated
- Need to establish partnerships, standards, shared vocabulary, etc., in advance of disaster events
- Need a precise, common understanding of processes, information & computation resources, and needs

Objectives

- Effective, efficient management of distributed systems for international, collaborative disaster management
- Clear roles of information systems and services in support of disaster management & risk assessment
 - Articulate scope of the disaster management enterprise
 - Promote a common understanding of components and roles
- Clear links between ongoing activities and overall enterprise
 - High-level view able to guide future activities
 - Esp. implementation of proof-of-concept prototypes
 - Shortfalls, gaps, redundancies identified
 - Complementary with GEOSS Architecture Implementation Pilot (AIP)
- Streamlined, easily automated access by decision-makers to data, services
- Lessons learned from real-world practitioner experiences

Approach

- Characterize and evaluate disaster response processes, *e.g.*
 - International Charter (multiple perspectives, esp. end-user interactions)
 - CEOS Supersites, SERVIR, and other components
- Identify case studies and WGISS contributions to GEOSS architecture
 - Characterize key proof-of-concept prototypes
 - Use these to ground the architecture in real-world examples
- Use a well-defined architecture framework to describe the GEOSS disaster management enterprise as a whole
 - Key classes of people, system components, processes/services, products
 - Shared understanding of relationships and interdependencies
 - Common terminology and high level interfaces
 - Apply and extend GEOSS Architecture Implementation Pilot (AIP)
- Infer requirements for CEOS, UN-SPIDER, and other portals
 - *e.g.*, search indexing; access interfaces; data priorities
- Capture lessons learned; recommended standards and products suitable as building blocks for sustainable capability

Scope, purpose, structure

Enterprise Viewpoint

- Scope & purpose based on CEOS WGISS charter; GEOSS Strategic Targets; GEO Task DI-01
- GEOSS principles
 - System of Systems
 - Data Sharing Principles
 - Interoperability Arrangements
- Disaster types ¹

| | | | |
|------------|-------------|-----------|----------|
| Flooding | Earthquakes | Volcanoes | Drought |
| Windstorms | Landslides | Wildfires | Tsunamis |
- Lifecycle phases ¹

| | | | |
|------------|---------|----------|----------|
| Mitigation | Warning | Response | Recovery |
|------------|---------|----------|----------|

¹ CEOS / GEO DI-06-09 report, "[Use of Satellites for Risk Management](#)" (11/2011)

Information content & semantics

Information Viewpoint

- General-purpose concepts from AIP-5 Architecture
 - Spatial referencing – Feature Model – Data Quality / Provenance – Data Policies and Licensing – *etc.*
- Observation needs by disaster type & phase – based on
 - CEOS / GEO DI-06-09 report, Use of Satellites for Risk Management (Nov. 2011)
 - GEO report, Critical Earth Observations Priorities (Oct. 2010)
 - GEOSS 10-Year Implementation Plan Reference Document (2005)
- Metadata
 - Locating & identifying relevant data
 - Assessing fitness for use
 - Georeferencing
- Semantics / semantic translation

Information content & semantics

Information Viewpoint

- Cross-cutting needs:
 - Frequent, high-resolution observations
 - Esp. for earthquakes, floods
 - Basemaps – *e.g.*,
 - Digital terrain models – Water boundaries – Ground control points
- Data operations
 - Preprocessing (*e.g.*, decoding, georeferencing, atmospheric correction – “Level 1”)
 - Analysis & Interpretation (incl. feature extraction)
 - Product creation (incl. “image pyramids”)

Computation and Services

Computation Viewpoint

- Generic service types – from AIP-5:
 - Catalog Registration & Search
 - Portrayal / Display / Styling
 - Data Access & Ordering
 - Processing algorithms
 - Sensor access & control
 - User management
- Disaster-specific service types:
 - Event detection
 - Sensor tasking
 - Data Analysis / Interpretation
 - Modeling / Prediction

Namibia Flood Pilot Sensor Web Concept

Computation and Services

Computation Viewpoint

- Cross-cutting needs:
 - Near-Real-Time data access / delivery
 - Data broadcast
 - Cross-community interoperability
 - Ease of use; ease of operation / maintenance
 - “Last mile” to end-users (incl. telecomm. infrastructure)
- Service-Oriented vs. other
 - Broadcast / push (LDM, GeoNetCast)
 - Physical media delivery

Upcoming Plans

Milestone

Date

| | |
|----------------------------------------------------------------------|---------------|
| Review recommendations from WGISS-34 meeting | Oct. 2012 |
| Reference Model v1.0 Release | Oct. 2012 |
| Contribute to AIP-5 Disaster Scenario / Architecture | Oct. 2012 |
| Draft architecture gaps / recommended enhancements | Oct. 2012 |
| Add'l case studies & recommendations | Nov. 2012 |
| Written contributions to AIP-5 architecture | Dec. 2012 |
| Circulate reference architecture v2.0 draft | Jan. 2013 |
| Release reference architecture v2.0 | Feb. 2013 |
| Findings on CEOS, UN-SPIDER (<i>etc.</i>) disaster portals | Mar. 2013 |
| Recommendations on disaster portals | Apr. 2013 |
| Implications for system implementation | Apr.-May 2013 |
| Review findings & recommendations @ Sensor Web Workshop, WGISS-35 | Apr.-May 2013 |
| Final release of reference architecture | Jun. 2013 |

GA.4.Disasters Agenda

- Project Overview: GA.4.Disasters – GEOSS Architecture for the Use of Satellites for Disaster Management and Risk Assessment
- GEOSS AIP-5 contributions and outcomes
- Findings from the July ESA forum on Understanding Risk with Earth observation
- GA.4.Disasters Architecture status
- Case Study findings
- Preliminary recommendations
- Next Steps

Framework: ISO/IEC Reference Model of Open Distributed Processing (RM-ODP)

- *Enterprise viewpoint*: the purpose, scope, and policies for the system. Often articulated by means of use cases.
- *Information viewpoint*: the semantics of the information and the information processing performed.
- *Computation viewpoint*: the functional decomposition of the system into objects interacting at interfaces.
- Two additional viewpoints will see less emphasis in v1.0:
 - *Engineering viewpoint*: the mechanisms and functions required for distributed interaction between objects.
 - *Technology viewpoint*: the choice of technology for implementing the system.
- RM-ODP is the basis for GEOSS Arch. Impl. Pilot (AIP), E.U. ORCHESTRA, OGC Ref. Model, and others

Framework: ISO/IEC Reference Model of Open Distributed Processing (RM-ODP)

RM-ODP Viewpoints

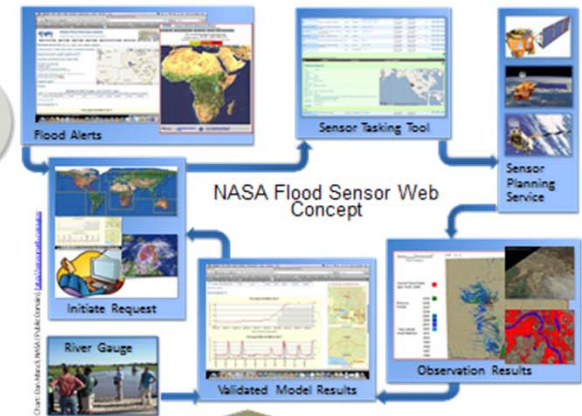

Disasters
Table 4.1.5

| Observational Requirement | Wild and Fire | Earthquakes | Volcanoes, Volcanic Ash and Aerosols | Landslides, Subsidence | Floods | Extreme Weather | Tropical Cyclones | Sea and Lake Ice | Coastal Hazards, Tsunamis | Pollution Events |
|--------------------------------------------------------------------------------------------------------------------------------------------|---------------|-------------|--------------------------------------|------------------------|--------|-----------------|-------------------|------------------|---------------------------|------------------|
| 1 Digital topography—broad, regional | 2 | 2 | 2 | 2 | 2 | | 2 | 2 | 2 | 2 |
| 2 Digital topography, bathymetry—detailed or high-resolution | 3 | 3 | 3 | 3 | 3 | | 3 | 2 | 3 | 3 |
| 3 Paper maps with natural (terrain, water) and cultural features (includes geographic names, all infrastructure and transportation routes) | 1 | 1 | 1 | 1 | 1 | | 1 | 1 | 1 | 1 |
| 4 Detailed mapping, dating of bedrock, surficial deposits, etc., dunes | | 3 | 3 | 3 | 3 | | | 3 | 3 | 3 |
| 5 Documentation/assessment of effects during & after event | 2 | 2 | 2 | 2 | 2 | | 2 | 2 | 2 | 2 |
| 6 Seismicity, seismic monitoring | | 1 | 2 | 3 | | | | | | |
| 7 Strong ground shaking, ground failure, liquefaction effects | | 2 | | 4 | | | | | | |
| 8 Deformation monitoring, 3-D, over broad areas | | 3 | 3 | 3 | | | | | | |
| 9 Strain and creep monitoring, specific features or structures | | 2 | 2 | 2 | | | | | | |
| 10 Measurement of gravity/magnetolectric fields—all | 3 | | | | | | | | | |

Legend for Table 4.1.5

- 1. Monitored with acceptable accuracy, spatial and temporal resolution, timeliness and in all zones worldwide
- 2. Monitored with reasonably acceptable accuracy, spatial and temporal resolution, timeliness or not in all zones worldwide
- 3. Not yet widely available or not yet assessed globally, but could be within two years
- 4. Only locally available or experimental, could be available in six years
- 5. Still in research phase, could be available in ten years

- What are the purpose and scope for using satellite data in Disaster Management and Risk Assessment?
- What activities are involved?
- In what organizational structures do (or must) these activities take place?
- Who are the participants in these activities?
- Who are the stakeholders for this architecture - who has (or should have) a say in how these activities use information from satellites (and elsewhere)?
- What other enterprises are linked to this one?

Enterprise viewpoint

Information viewpoint

Computation viewpoint

Engineering viewpoint

Technology viewpoint

- What observations or parameters are needed when responding to different kinds of disasters (or assessing their risk)?
- In what forms does this information best support the enterprise?
- What metadata are needed to ensure that data can be found and appropriately used?
- What inter-dependencies exist among these data products?
- What data transformations, interpretations, extractions, syntheses, etc. are needed between sensors and users?

- What service types are needed to make the necessary data available to users?
 - > e.g., data access, visualization, catalogs
- How will these service types effect the data transformations, interpretations, extractions, syntheses, etc. between sensors and users?
- What requirements apply to these services and interfaces (e.g., near-real-time performance, cross-community interoperability)

Enterprise view: purpose / scope

- GEO Task DI-01, “Informing Risk Management and Disaster Reduction” seeks to achieve the following:
 - More timely dissemination of information from globally-coordinated systems for hazard monitoring, prediction, risk assessment, early warning, mitigation, and response.
 - Multi-hazard and/or end-to-end approaches to disaster risk reduction, preparedness, and response.
 - Support for the Hyogo Framework for Action 2005-2015.
 - Improved use of observations in policies, decisions and actions associated with disaster preparedness and mitigation.
 - More effective access to observations to facilitate disaster warning, response and recovery.
 - Increased communication and coordination between national, regional and global communities.
 - Improved disaster response through delivery of space-based data, via the International Charter on Space and Major Disasters.

Enterprise view: purpose / scope

- GEO DI-01 focus areas:
 - Provide support to operational systems
 - Enable and inform risk and vulnerability analyses
 - Conduct regional end-to-end pilots with a focus on building institutional relationships
 - Conduct gap analyses in order to identify missing data, system gaps, and capacity gaps
- GEO DI-01 components:
 - Disaster Management Systems
 - Geohazards Monitoring, Alert, and Risk Assessment
 - Tsunami Early Warning and Hazard Assessment
 - Global Wildland Fire Information System
 - Regional End-to-End Pilots
- GEO DI-01 implementation Resources

Enterprise view: Stakeholders

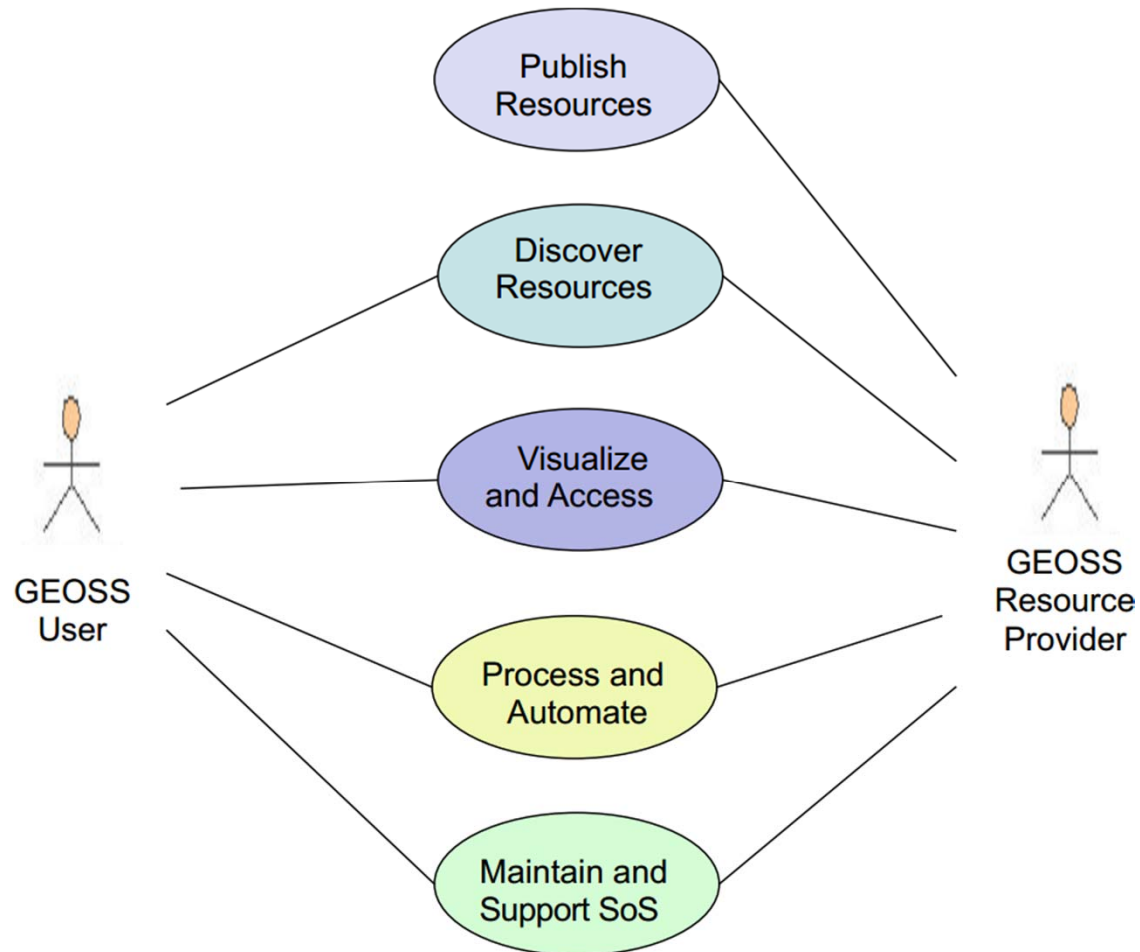

- Often mentioned; seldom characterized or enumerated
 - Case studies will shed light on this from practitioner perspectives
- GEOSS AIP-3 (01/2010): “targeted or supported” communities
 - National agencies concerned with disaster management, meteorology, hydrology, and emergency response, and their supporting providers of data, services, research, and analysis
 - CEOS Strategic Implementation Team (SIT) and WGISS
 - GEOSS' DI-06-09 (=> DI-01) Task
 - UN-SPIDER
- GEOSS AIP-3 Disaster Management reference scenario:
 - Initiators (*trigger and coordinate the disaster response*)
 - Actuators (*respond to disaster – e.g., regional civil protection, insurance companies, NGOs*)
 - Processors (*provide raw data or derived information*)
 - Coordinators (*facilitate interactions among the other actors*)

Enterprise view: Processes

- Information support activities (from GEOSS AIP-5 architecture)

Enterprise view: Principles

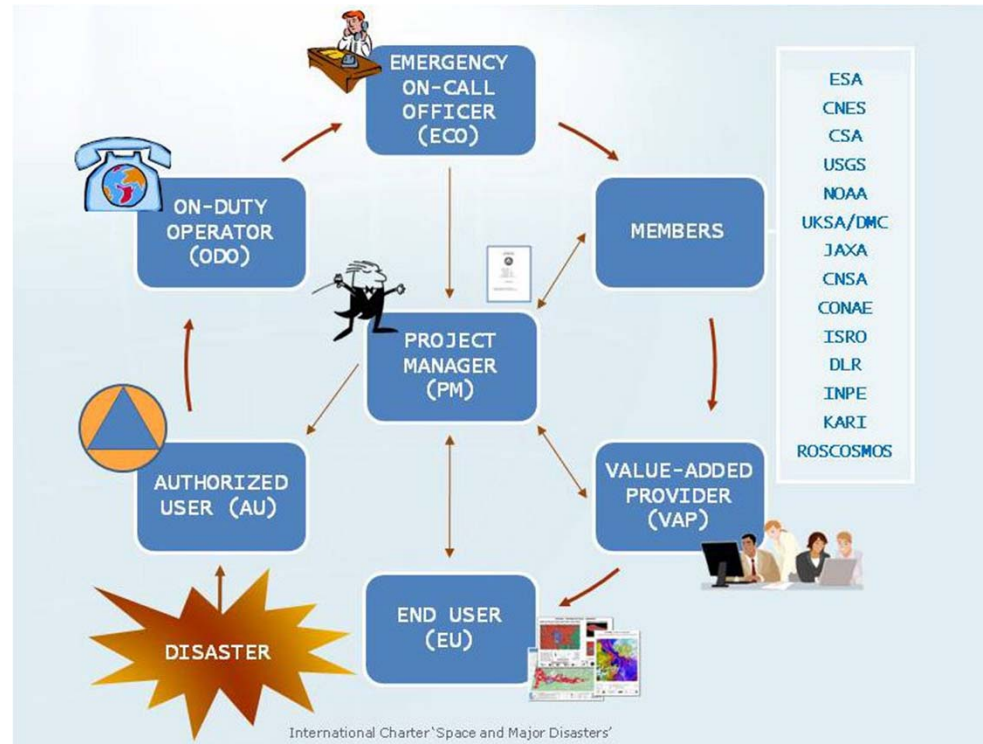

- System of Systems
 - Independently operated systems contributed to (also) serve shared purposes
- Data Sharing Principles
 - Full and open exchange of data
 - Minimum delay and cost
 - Support to research or education at zero or marginal cost
- Interoperability Arrangements
 - Industry or international interface standards (*generally*)
 - Adopted by the GEO Standards and Interoperability Forum (SIF)
 - Maintained in the GEO Standards Registry

- Example: International Charter

- Supply space-based data to relief efforts in the aftermath of major disasters

- Differences in scope w/ GA.4.D enterprise:

- Support disaster relief – not research, prevention, *etc.*
- Supply data products – not original data or end-user services

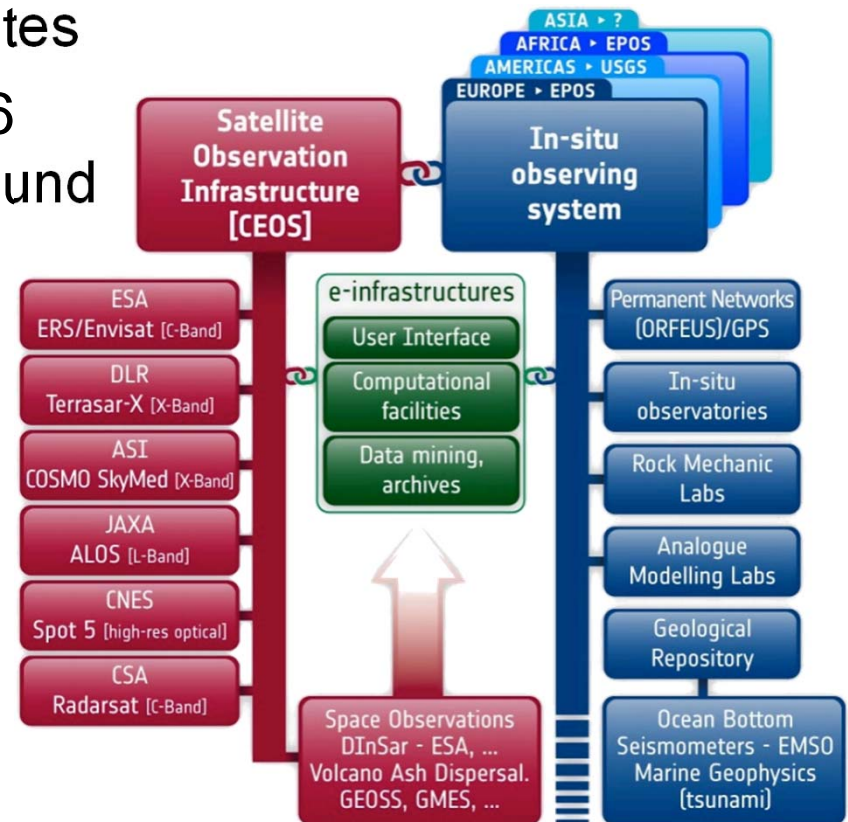

Enterprise view: points of comparison

- Example: GeoHazard Supersites
 - Open access to data for 16 seismically active sites around the world
 - Spaceborne SAR; GPS deformation measures; earthquake observations
- Differences in scope with GA.4.D enterprise:
 - Seismic risks only – not floods, storms, *etc.*
 - Emphasis is on research – not operations (*so far*)

Progress so far

- Facilitated interagency development of a reference model
 - WGISS (NASA; CAS/China; GISTDA/Thailand; NASU/Ukraine; UKSA; CISR/South Africa; United Nations SPIDER)
 - CEOS (CSA / Disasters SBA; NOAA & USGS / CEO; LaRC / SEO)
 - USGS / Int'l Charter
- WGISS-32: Clarified scope, structure, priorities
- Presented project concepts at AGU, ESIP
- Coauthored IGARSS abstract w. OGC/GEOSS AIP
- Circulated 2 draft architectures
- Identified practitioner case studies to validate the viewpoints
- Joint Development Meeting with Disaster SBA Team
- Practitioner case studies now underway (*more on that in a bit*)
